Still Looking for the operational manual for a Philips AL990
communications portable receiver. A service manual would be a big plus
as well. Will be willing to pay copy fees and shipping or I may have
some literature you
need? Thanks in advance, Picture of radio is shown below! email me
directly at rlonn@home.com

I wanted to extend the life of the tubes in my old boatanchor radios, like the Hammarlund HQ-129x I've been using for AM BCB DX'ing lately. So I fixed up a filament inrush surge current suppressor using a thermistor designed for that job. I call it my "Tube Saver" and I hope that name is not someone's registered trademark.

I only just finished it and I'm still testing it, but I wrote up my information and parts list for the project and posted it on my web site at http://users.netonecom.net/~swordman/Radio/TubeSaver.htm

Pictures of all the parts, the assembly process and the completed unit are posted at http://members3.clubphoto.com/doug251926/TubeSaver_Parts/. There are 24 pictures all together, all taken with my Sony Mavica FD-73 digital camera, at 640 x 480 resolution.

Howdy Bill....Been a LONG time since I had one of those (my 1st 2meter rig!). Wish I still had some paperwork on it - here's what I recollect. Seems they were tube type transmitter (driver/final maybe) using pencil (wire lead) type tubes - 1watt output (if I recollect for the H23 series). 5watt output model used same tx but had a (memory don't fail me) 2E26 I "think". Receivers were transistor as I recollect. Carbon mic setup (I used a telephone transmitter - mic). The bottom section, as you see, is for the power pack - some had a narrow pack (1 watt H23's) which used dry cell packs like the old time radios - The A pack was similar to 4 C or D cells - I "think" the B pack was 90volts....was there a C (?) Some of 'em (P33AAM I believe a 5watter I also had) had a transistor DC-DC converter which used a 6volt lead acid battery (as I recollect). Someone out there has your good info - sure brings back memories - one of the neatest looking rigs of my youth! (heck, even had one strapped into the "triangle" part of the frame of my 2nd hand bicycle - 1/4 wave on a plate on the back carrier heheh).

====================
Democrat voters claiming stupidity in this election
are no real surprise - they had already PROVED THAT
in the PREVIOUS 2 elections...

"Bill, KD0HG" <private@nospam.org>

(BUNCH of stuff trimmed, since MOST is summarized here:)

> I don't know why you imply the T'Bolt supply is 'weak'. That's a good
> kilowatt-sized piece of iron in there, way larger than you find in
many
> contemporary sideband linear amplifiers. It's probably twice the
rating of the
> one that came in my Dentron MLA-2500. Better yet, the T'Bolt supply
uses a
> conventional full-wave design, rather than the common voltage-doubler
topology
> used today- another plus.

BUT, the issue is NOT about class C CW - it IS about using the
Thunderbolt in class AB1 or 2 thru a 45 year old amplifier! After all,
the guy SPECIFIED a Ranger on AM as the driver! Think what you will, but
expecting to obtain a RELIABLE 400-500 watts INPUT with the Tbolt in AM
linear service IS an invitation for disaster! A steady 400 watt carrier
input will require an accompanying 800 watt voice peak capability for
proper AM modulation levels, even in linear service - the combination of
400 watts STEADY power supply drain with the addition of voice peaks IS
pushing the Tbolt. Comparing the power supply in the TBolt with a
MLA-2500 is a smoke screen and non-sequiter, since the 2500 isn't being
discussed here, and is ALSO a poor choice for linear AM amplifier use
for MANY of the same reasons as apply to the Tbolt! In addition, while
the "iron" in the Tbolt IS hefty, it is ALSO old-technology, compared
with the more compact tape-wound and Peter-Dahl types found in or
available in more modern high power gear. An aside, the power
transformer in the Tbolt isn't the main point of contention - but the
CHOKE is, and many of them failed when pushed hard - including the one
in MY first Tbolt. Whether or not the full-wave system as compared with
a properly designed doubler is a plus or not is arguable, since a very
good argument CAN be made for the better margin of safety provided by
the lower voltage potentials in a doubler-type transformer.

As far as control circuitry for Tbolt use with a modern transceiver, I
built one for an old Hallicrafters HT-33, which is pretty much the same
```

as that required for the Tbolt - no real big deal, but still somewhat "klugy" and noisy (my available transfer relay was rather large...).

> I would replace the electrolytic filter caps in any rig of that vintage as a
> matter of course, and replace the 866 rectifiers with 3B28s or even silicon
> stacks. The T'Bolt is the original key-down-with-brick linear amplifier.
> There's nothing 'weak' about it.

My memory may be failing due to old age, but I coulda' sworn the Tbolt used oil-filled HV caps in the HV supply - but of course the low voltage supplies no doubt should be checked thoroughly, and a switch to SS rectifiers is CLEARLY a plus... Shucks, *I* wouldn't mind locating a clean serviceable Tbold at a reasonable price for use with the nostalgia 20A sitting on the shelf above my IC-746 and TS-570... 8^)

6. Boat Anchor Prices

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-01-01 03:20:26 UTC
From: Roger Halstead <rdhalste@tm.net>
Message-ID: <_HS36.856$8r2.97329@newshog.newsread.com>
Source record: 57916

Any one besides me notice that the average prices on e-bay are headed down hill with only a few exceptions in the case of certain old tube type equipment.

I've been seeing more and more pieces of equipment not even making minimum bids that would have sold only a month or two back.

There has been a seller I'd not noticed before, although he shows quite a few sales to his credit that had a very high percentage of his good stuff not even get a bid the past couple of weeks.

Must be that spare cash was coming from the market.

I have even seen LESS equipment than ever in each of the categories. Here in Dallas eBay is advertising like crazy on both the newspapers and on TV. Could be XMAS is a factor but I doubt it.

Maybe everyone got all the stuff they have been looking for all these years? - Or perhaps everyone figured out old radios are a even poorer investment than the NASDAQ.

Eitherway, that's more for me! - errrrr I mean us.

Hey Doug-

I have a Zenith AM/Clock that had a red ad on the back about a "tube saver" which had to have been something like this. Of course it was bad :)

Why not mount this inside the set.. perhaps in a metal box and do away with the sockets and plugs? I like the idea for some of my consoles with the harder to find tubes.

More of a caper in series-string TV sets than clock radios was a series carbon resistor called a Glo-bar that at its temperature equilibrium acted like a tube in the string to bring up the voltage drop to line voltage at say 150 milliamps. When cold, carbon resistors are much higher in resistance than when warm (opposite of the metal filaments in the tubes) so the Globar limited the current surge when the unit was first turned on. Actually did some good.

Just as a guess, I would bet the tube line-up is 12BE6, 12BA6, 12AV6, 35W4, and 35C5 which only adds up to 106 volts. Your tube-saver was probably about 8-10 ohms hot which at .15 amps brought you out nicely in the 118-121 range.

Doug has a different problem with 6.3 volt parallel-string tubes.

I just list and sold on ebay 5 items at my reserve. I think what you are seeing is that a lot of the not rare or good preforming radios are the one that have finally hit the dust. The good preforming are rare one are still going up. From past history the listing will go up after the New Year and around tax time come down and then a month later come back until summer at which time everyone is fishing. Anyone see a SX-88 on ebay with no bids? It also depends on how people are listing the STUFF if it only has a fixed price that is at the value of the radio they usually get no bids. If it is a reserve auction the reserve will usually get met. Just my two nickels worth.

Used to call it a Glo-Bar dropping resistor, kind of a staple in
several 4 tube with dial light receivers, and 5 tubes without dial
lights. 4 tubes would be something like 12BE6 12BA6 12AV6 and 50C5
5 tubes would add a 35w4 rectifier, and the filaments would all be
strung in seriers across the AC line.

However in my experience, filmanent opening up is low on the list of
things that cause vacuum tubes to die. Usually it is the thoriated
cathode that runs out of thorium, or an internal element opens/shorts.

If you really want to extend the life, take a lesson from the
broadcast industry. Put the filaments on a variac, run them just hard
to achieve satisfactory operation. This has just about doubled the
life of the big Transmitter tubes (4CX15000 etc). Increase the
filament voltage as needed. Eventually the filament will burn up, but
at that point the tube is finished anyway.

Better protection for tubes would be to delay the B+ for a period time necessary to completely warm them up. This is more useful on rectifiers and power tubes. This has been done many times over the years. I think Motorola used a B+ delay in 60's vintage TVs that was called a Tube Saver.

Can anyone please point out to me any British-made ham AM transmitters that employed hi-level plate modulation? (As opposed to efficiency modulated rigs).

Thanks.

Rich.

>at that point the tube is finished anyway.

Last night I was glancing through a '65 Handbook and happened to spot a piece of advice in the transmitter chapter concerning where to keep the filament voltage. The recommended minimum was the rated voltage with a maximum of 10 percent above the rated voltage. Nowhere did the ARRL gurus suggest running tubes *below* the specified filament voltage. It would seem as if they were implicitly warning against it, in fact.

Were they just going with the conventional wisdom of the time? Were they wrong? Are there any studies backing up either the broadcast practice you describe or the Handbook advice? Did transmittinge tube manufacturers have something to say on the subject?

It would seem logical, but very possibly wrong, that the best practice for receiving tubes would be to run them at the rated voltage but keeping in mind that with many households fed on 125 volts or higher these days (we're one of 'em), the filament voltage in many radios may be running high by 10 percent or so.

I've followed many threads on the subject in various forums. Nobody seems to agree, but most of us haven't truly studied the subject. We're just spouting off--and I'm one of the guilty parties.

I think Ron is absolutely right both about the cycle in ebay prices and about desireable gear. Quite a bit of the premium equipment that doesn't sell comes in with a high reserve that has the effect of discouraging would-be bidders, even if it is a realistic reserve (like the $4K on a nice Collins 380 recently).

OTOH, a good radio with no stated reserve is still a bid magnet. I didn't stick around for the winning bid, but a Hammarlund HQ-180A was up to $600 or $700 when I checked the price a few days ago. It wasn't described mint, either. (Maybe it was because it still had the clock...?<g>)

I don't think many receiving tubes use a "thoriated cathode", don't they
use barium or some such?

We have a large number of classic UK boatanchors in stock including
some real "hard to find" classics.
All our prices include air transport to the USA which takes 4 to 5
days. Prices are in US dollars.
Please take a look at our site at http://www.radio-exports.com
All feedback most appreciated.

All the best for the New Year !

I think the Labgear rig with an 813 in the final had high-level mod.
Also the 'Elizabethan' by G5RV, but that was for home build.
There was also a mobile 2m rig by TW Communications that had H/L AM.
Also some of the early KW stuff.

> recently).

I have to agree at least with the quality, reserve, and high minimum bids as the majority (there are some exceptions) of stuff that received no bids had a high minimum bid.

Two exceptions were a Viking Ranger that went for $380 as I recall and a SX-115 that went for $375. That was a nice 115 too. Not collectors quality, but as nice, or nicer than some I saw go for over $1,000 just a month or two back.

I saw a 2-meter 160 watt amp with a minimum of 225 just sit there, but one with a very low minimum bid went for over $200 and there is one now up to $190

I still see the occasional piece of junk go for amazing prices and I am also seeing more bargains, where last fall a bargain was a rare event.

Another thing I've noticed is quite a number of ISM amplifiers grossly misrepresented, or to me they were misrepresented and people pay high prices for them. One was a Henry amp set up for 20 meters only. it was represented as only needing a band switch to cover most of the ham bands.

That sucker had tune and load caps that used a teflon dielectric and compression, which work well in ISM amps, but are very narrow range.

To put it on the ham bands would require the T/R and bias switching relays, a new tank coil, band switch, tune and load caps...Lots of work and expensive unless the buyer had a healthy junk box. For a dedicated home brewer, it would have been a whale of a start though.

> (Maybe it was because it still had the clock...?<g>)

And it worked?? <G>

There are the occasional ones that go high, but it sure isn't like it was in
the Fall.

As Bubba did, I've noticed a drop in the number of items as well.
That could be due to items, on average, bringing less and the sellers want
to wait for the market to come back up.

Certainly there is currently far less discressionary income than two months
ago.

It will be interesting to see if it comes back up with the stock market, or
seasonal cycle. I've not followed e-bay long enough to be aquainted with
its seasonal cycles.

From: w8kzw@arrl.net
Message-ID: <92qd3j$5th$1@nnrp1.deja.com>
Source record: 57937

For Auction: Drake TR7 Station with accessories

Here is an opportunity to acquire a dream Drake TR7 Station that works as beautifully as it looks.

This station is available only as a package. If you don't need everything, buy it all anyway and sell what you don't want! The pictures really don't do this gear justice. I am the second owner – both of us non-smokers.

The package includes:

TR7-1337 / DR7 Transceiver

Serial #1101. Includes Network Sciences 7705 2.3 kc sideband filter, and 7806 500 hz cw filter. The front panel is virtually perfect, except for some very fine scratches on the plastic covering the display and meter from being cleaned with paper – noticeable, but not nearly as pronounced as the photos suggest. Some very minor scuffmarks on the cabinet. Original manual.

PS7 Power Supply

Heavy Duty. Excellent condition.

AUX7 Board

In original box. Never installed. Includes 2 RRM-7 IC modules – pin 10 removed only.

WH7 Wattmeter

Mint except for a fine scratch on the bottom left hand side of the front panel. Original box.

MS7 Speaker

Front perfect. Light scuff marks on cabinet.

RV7 Remote VFO

Panel perfect. Two barely visible scuff marks on left hand side of cabinet. Original box.

Payment by certified check preferred, but personal check ok if you can wait until it clears before I ship.

Add $40.00 for packaging, shipping, and insurance to lower 48.

See / bid on the gear at:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1205194834

Hi All,

I have a Heathkit SB-100 that is going to need more help than I had hoped. Don't know what I will find when I have been all the way through this. For now though I know that I need the choke that provides HV to the 6146 Finals. It is labeled "L-901" in the schmatic and is a 425uH RF choke that mounts vertically on a ceramic form inside the finals cage on the SB-100. The part number that I have is 45-41. This is the same part labeld as either "L-901" or RFC-901" in the HW-100 and HW-101 as well as the SB-101 and SB-102.

If you have one available please let me know.

> >
If it is being driven by a high-level modulated source, the PEP output
requirement
will be 4 times the carrier power. For example, if the amplifier carrier
level is 100 watts,
the PEP output requirement will be a minimum of 400 watts; and more if
assymetrical
modulation is used. If not, the output will clip on modulation peaks and
you will have very
serious splatter issues.

I think you're talking about the grid circuit in the final, you must be.
Actually, I suppose it would be called control grid modulation: Whatever it
is it's surely a form of efficiency modulation. (Says me who is no expert
in these things).

Rich.

Mine used earlier metal cased NiCad batteries. You open the cells via a top screw and more electrolyte if needed. There was also an AC supply that replaced the battery pack.

Someone out there has your good info - sure brings back

The LG300 would run the full 150w of AM.
The Elizabethan had 2x6146 in the PA so about 100w of AM.
The TW Communications was 10w AM on 2m. (Xtal controlled)

Hi,
I for one, suspect that the stock market was generatng quite a lot of disposable income.
It may also be that there were more of these old gems floating around out there than was originally thought. Now that many folks have acquired what they wanted in the lines of 'common' sets, they are backing off. The 'special' sets still command hgh prices.
I personally have a soft spot for NC57's and have noticed for a few months that the median price has dropped from $95.00 to abut $60.00. There is presently an NC57 with both a Select-O-ject and an SM57 'S' meter on epay currently running at $230.00. This shows that the 'special' odds and ends will still draw bidders.
Hopefully, this trend will continue and the prices will level off to a more reasonable range....
rgds,
Mark S.

To add another to your list
TR5, Tiger Radio, 150W Am 100% modulated using 813 final and pair of KT88s
for anode modulation.

I still have it although I wouldn't swear it is still working. Comes in 3
modules, Power supply/modulation amplifier, VFO /driver, Final. Each weighs
at least 40 lbs and it sits on a trolley base.

I am interested enough to ask why you wanted to know this information.

Old HT-40 Hallicrafters transmitter in excellent condition
with an Old Eico model 722 VFO. These are both in really clean and
unmodified condition. I'm positive that they will operate if plugged in,

although I have no manuals for either of them, and know nothing about
them other than they came from an elderly gentleman's estate in
California. He was a ham. I can supply e-mail pic for seriously
interested party. Will consider realistic offers only and you pay actual
shipping charges.
Bill

Hi Alan

The reason I ask is that I'm after buying an AM rig, homebrew or otherewise, with a decent level of AM RF out, say 150 watts PEP. To date every rig I bought either has no AM (Didn't realise KW2000A has no AM at all - Duh!) or is efficiency modulated (As is my KW Viceroy and my Labgear LG50 and Topbander). So, I need to know which sets with AM were anode modulated.

(I am surprised how early AM became a token prescence on HF rigs and when SSB began to take over, I imagined in the late 60's early 70's, but seems like late 50's).

I believe you can only amplify low level AM with a linear amp, but that's not a very efficient way of acheiving increased output. (But to acheive 400W PEP with a 150 W rig one would have to use a linear).

I bet there is a book published somewhere that describes these older AM rigs and the method of AM modulation, might be good if I got one.

Of course any CW rig can be modified to AM, I could just buy or build a modulator.

Is your Tiger TR5 for sale may I ask?

Rich.

52. Re: British AM Hi-level Plate Modulated Ham Rigs

Before someone points it out: Actually, the final of the KW Viceroy
is not efficiency modulated. I'm not sure how AM is produced throughout
the entire circuit run. Low-level carrier is injected into the balanced
modulator producing low-level AM and I think the final amp will operate as a
linear amp. Don't know what happens in between, I expect linearity though
in the circuits.

Rich.

Certainly was Codar Walt, its companion Rx was the T28, which relied
upon it's 'netting' facility to resolve SSB.

Personally, I have used AC/Delco plugs for all of my life and find
them very good. Also consider replacing the plug wires with GOOD
quality ones.. Something like BELDEN brand. Do NOT but discount store
plug wires.
Also consider at least checking the distributor cap if the Jeep has
one, and rotor inside the cap again if it has one. Obviously it may
not have one due to the newer electronic ignition system.

Another RF Suppression technique is to ad a GOOD ground wire from the
engine to a good clean chasis ground, and also from the rear end of
the exhaust system to the frame. I find this helps a whole bunch while
operating on HF.

You can usually fix them, most of the time some jerk dope always loosens the
top screw to remove Good 6146's before selling.
"Breaking the wire from the solder ring"
Check the lower ring also, peel back some turns and resolder.

From: Rob Dunn <dunnr@ix.netcom.com>
Message-ID: <92svfu$501$1@nntp9.atl.mindspring.net>
Source record: 57868

Hi all,

I have a question for the experts out there. What if any are the differences between the 6146, the 6146A, and the 6146B? My question is partly curiousity, I have seen these part numbers interchanged in several old tranceivers, and manly because I need to test a pair of 6146A's and the only settings I can find are for 6146. My tube manuals only list 6146's so I can't do a comparison of the specs myself. Any advice is appreciated.

73, Rob, KD7HRN

Greetings,

I want to find a good home for a Dumont OS-44/M rack mount variable
persistance oscilloscope. It has an inspection and calibration sticker
for
PuebloOrd Depot dated 1962 I think they made it in the 1950's .

Does anyone know of a person or organization that
collects old test equipment? If you do, please send me their
phone number or send them my email address.

If I can not find a home for it soon, it will go into the local land
fill.

Sincerely,
Bill_Thomas@hp.com

Don't think it will make much difference or show up on a tester - some variations in the 6146 relate to structural durability under vibration as in mobile service, others are to ability to perform under varying filament voltages - seems ONE of the variants provided slightly more plate dissipation - but NONE of those issues are likely to affect the usual tube tester settings...

All Gear working last time tested unless noted. Shipping is extra. Please reply to my email address(mars@mochamail.com). Will consider trades on computer EQ. Let me know what you have to offer.
Thanks

Tempo-1: All Tube Ham Transceiver with Power Supply. Covers 80-10 meters. Looks good and works well. $200

Pearce Simpson: Guardian 23- All tube CB Transceiver/with mobile power cord and mounting bracket. Looks and works Good. $100

Swan 14X DC Power Supply Module: No way to test but was told it was working OK. As is $45.

Siltronix Model 90-6 VFO: Excellent condition with three position crystal switch $60.

Marantz Model 2220B: Stereophonic Receiver, with gyro-touch tuning, blue dial and optional real wood case. This unit is in excellent condition, both in looks and operation. I would rate a 9.7. Also have original manual, in excellent condition. $200

AR Inc: Stereo Amp, All solid state. $100. Please don't ask the model #. I have been asked this many times and unable to locate on the name plate. The serial # is: AA002291. It comes with the optinal wood case the face is Gold Alumi. With the following controls: Mode selector, Bass, Treble, balance and volume. In the upper left corner is a red LED and on the bottom right is a normal/monitor switch. I would rate it a 7 on appearance. Also have an identical spare. Operating condition unknown. Does not have the wood case. $50.

Channel Master: Tube Stereo Receiver (Model 6612) and matching amp (Model 6601) Looks good and plays on FM only. AM not working. $100

Traynor: Group Two B- Audio Amp Head. High/ Low misc. in puts. Master volume,
volume, bass, treble and tone shaper controls. All solid state $125

PRO 2003 Scanner: Radio Shack 50 channel(30-512 Mhz.) Digital Scanner with FM broadcast band included. Have two, one is working the other is a complete non working unit. $115 for both.

Bearcat 250 Scanner: Have two. One working at times and one for parts. $50 for both.

RS Pro 30 Scanner: Hand held 16 channel Digital scanner. Looks & Works good, but the battery cover plate is missing $30.

6146--Original type introduced by RCA in 1952. 20 watt anode dissipation.

6146A--Improved type (1961) Ruggedized for mobile use, including "Dark Heater" for longer life. Still 20 W dissipation.

6146B--Final type (1963) Uprated to 27 W anode dissipation. Heater current reduced by 125mA, Improved base design.

6146Bs will replace any of the earlier variants, and will last a lot longer if run at high dissipation. 6146B is identical with type 8298A, and often have both designations.

That lamp limiter is a good idea. It doesn't do the same thing, though. A lamp filament's resistance is very low when it's cold, just like a tube's is. As the lamp heats up, its resistance will increase (PTC) and reduce the current thru the load.

The lamp limiter is especially good for testing devices that might blow a fuse or cause damage to themselves or whatever they're connected to. Like if a radio has a shorted filter capacitor, or if you're testing how to hook up a motor. It's a nice visual indication of the current draw, but it has the opposite temperature coefficient from the NTC thermistors. It would help tube filament life too, but not as much.

The B+ delay is also a good idea, but only the communications type receivers typically have the switch. The HQ-129 does, for example. But that doesn't help the filaments any. And in the case of the HQ129, it only switched off the B+ to half of the tubes, so the rectifier and filter still have the same inrush stress anyway. Of course, they've always had that and are theoretically designed for it.

Some of the comments on this thread triggered an old memory about
a similar problem with some hi-power television broadcast tubes. At
the local UHF station they had a similar problem with short tube life
back in 1958. A brand-new RCA 12kw transmitter had been installed and
was costing a fortune to operate due to the cost of replacing the
finals. (Don't recall the type) The tubes had very short life and the
factory had no solution.(RCA) So the local chief engineer decided to
install variacs in the heater circuits and stage the heater voltage
up very slowly. Over a period of months of experimentation, the
engineer found that 30 minutes of ramp-up time was good. The results
were so good that RCA sent a rep down to find out why WFMJ-TV was
taking so long to replace the finals! When the 12kw was finally
relegated to backup service when the klystron transmitter was installed
in 1968, the same tubes had been in the finals for 5 years as I seem
to recall.
Inrush sure can shorten the life of any tube it would seem.

-Fred Sole

This thread reminds me, the TransOceanic book by Bryant & Cones recommends installing a varistor on each leg of the power line to protect the tubes. I have never tried it, but the tube TOs seem like good candidates for protection, given the low-voltage tubes (esp. the expensive 1L6).

Other candidates for protection would be the early radios using very expensive tubes, of course. I don't collect those sets, but if I did, I'd be concerned about tube conservation.

For run-of-the-mill radios that I have thoroughly restored, I just turn 'em on and don't worry about it. Apart from TOs, all the radios in this house use tubes that are pretty common & inexpensive to replace. Some of my sets (including my favorite boatanchor) play for hours a day, year in and year out. I can't remember the last time one of them lost a tube -- knock on wood :-)

Happy New Year.

re: Swan 1011 and Siltronix 1011 Tranceiver web page.

Hello there!

Another shameless plug to tell people about the updated Siltronix web page at http://sonic.ucdavis.edu/siltronix

Hot off the press! We have added pictures of the prototype Swan - Siltronix 1011 tranceiver. Even better yet, we've added more text information and an Owner/Service Manual down load for free.

Life doesn't get any better... well maybe, but not yours. Have a look and Email us what you think.

thanks and 73's

cheers
skipp@pilot.ucdavis.edu

Source record: 57798

I have a mil surplus modulator unit from APS-104 search radar (likely from B-52 bomber - 1960s vintage). Was used to fire a large pulse magnetron (in another unit). Contains a 4C35 thyratron, four 3B29 HV rectifiers and a few smaller tubes, oil caps, relays, transformers and other parts all in airtight aluminum canister. Also have copy of service manual (extra $5 for all, n/c for just the basic schematic & info). Still in original box, but used, collector's item, $55 (prefer pick up - box exceeds UPS size limit).(For an additional $20, I can shave down the foam insert and modify the box for UPS shipping, just takes a lot of time & effort to do this, and will cost at least another $40 to $60 to ship 105 lbs.) Located in southeast Alabama, 36330 zip. Please REMOVE the"05" to reply or call 334-347-5281 day/eve.

Message-ID: <9324fs$r3c$1@mailint03.im.hou.compaq.com>
Source record: 57813

I have an East German SEG-15 HF manpack / vehicle installation for sale ore
trade
It is made in the late 1970's, very complete and consists of:
Basic SEG-15 manpack 2 to 12 MHz, SSB, AM and CW, 15 Watt
AC powersupply 127/220 volt, DC vehicle powersupply 12/24 volt, Battery
powersupply
Manpack carrier frame, Vehicle carrier frame, Telescopic antenna.
Accessory box with: CW key, handset, headset, mic, tools, power leads,
antenna leads, flexible antenna base and small material like fuses etc.
The SEG15 can easily be modified to extend the frequency coverage to 16 MHz

I'm asking 380 US$ or trade for British Larkspur or Clansman HF manpack sets
I can send pictures of the installation when interested.

About 24 years ago (1976), when I was single and had money, I tore out the vibrator power-supply in my AN/GRR-5 boatanchor and installed a LM317 regulator-based slow turn-on power supply to provide 1.4VDC over 30-seconds to the filaments of my 1.4v-tubes (7 in all + one 3V tube)). This is a kludge of a set (ca. 40-50 lbs) with separate power supply/receiver sections that covers the 1.5-18MHz SW-regions. Got the slow turn-on circuit right out of the 1976 National Semiconductor Linear Data Book (still have the book). Circuit is very simple. Besides the LM317, a 2N2905 transistor, a 1N4002 protection diode, 3-resistors and 2-caps complete the circuit. Input voltages of 3-40VDC can be rock-solid regulated to 1.4VDC @ 1.5A with a slow turn-on (depending on the timing cap in the circuit). In my case, 10-mics gets me ca. 30-seconds. Great radio. Use it almost daily. Gave it to my football-player of a teenage son a few years back and it's still working like a charm despite the brutal treatment that only a teenager can administer.

Greetings from Texas!

I'm looking for a coaxial transfer switch, the type used to
select or bypass an amplifier, antenna tuner, or other coax
fed device. I know B&W made one, and I'm sure there were
others too. I need one with SO-239 connectors.

The silly thing is, I used to have one of these that I got
in a box of stuff from an estate, and I sold it because I
didn't need it at that time. Lesson learned the hard way!

From: Nick Kennedy <nkennedy@my-deja.com>
Message-ID: <932ed0$m4v$1@nnrp1.deja.com>
Source record: 57819

Straight Key Night is always advertised as having classic equipment as a secondary theme, but this is the first time I've seen it. Usually my arm gives out after pumping the J-38 for one or two QSOs, but this year it loosened up and I worked about eight.

BA stations included a Viking 2 and R-4B, a DX-35 and AR-3, and an HT-40 with HA-5 and HQ-180. The classic rigs all sounded great.

The guy that gets the award for sheer courage is W8DO, who was trying to work as many states as possible with a DX-35 and an AR-3. Imagine it, an AR-3! Working stations on these old transmitters is easy, but trying to have a QSO on some of these cruddy old general coverage beginners receivers is another thing entirely. I'm almost inspired to try to have a QSO with my S-120, one of the worst ever.

I remember the AR-3 from the 1962 Heath catalog. It was $29.95 without a cover and the oilcloth over particle board cover was another $4.95.

I used my HT-40 "novice" transmitter, Heath VF-1 VFO and Drake 2B, plus the Johnson Matchbox and J-38. See you next New Year's Eve?

I just spoke with a man in New York State (Albany area) that says he
has lots of Tektronix BoatAnchor Scopes (mostly tube type) for give
away, trade, etc. if you can pickup (or maybe pay shipping-- but these
are very hard to ship). He doesn't have usenet and is not interested
in Ebay.

Send him email-- I am not in the loop. Just a favor.

Joe: joseph.oneill@ogs.state.ny.us

Good luck.

Steve.

For Sale: GRC-9, DY88, GN58 and accessories.

I have a GRC-9 installation in good condition, a DY88 that was build in 1967
and never used still new in the box and a GN58 hand generator. I have most
GRC-9 accessories as well.
If interested I can provide pictures of the set.

112. WTD: Coaxial TRANSFER switch, B&W or similar (MORE INFO THIS TIME)

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-01-04 20:35:17 UTC
From: k5dh@raytheon.com
Message-ID: <98556.30$j6.1868@dfw-service2.ext.raytheon.com>
Source record: 57822
Cross-posted to: rec.radio.swap,rec.radio.amateur.boatanchors,rec.radio.amateur.equipment

Hello again...

I'm looking for a coaxial TRANSFER switch, the type used to either insert into a coaxial line or remove from a coaxial line an amplifier, antenna tuner, or other coax-fed device. This is NOT just a coax selector switch. It is a TRANSFER switch. There's a big difference. The switch must be able to handle at least 1 KW PEP.

Below is a diagram of how the switch I seek works. The verbal labels ("Exciter", "Antenna", etc) are only there to illustrate how the switch might be used, they're not marked that way on the actual switch. I intend to use it to bypass my antenna tuner.

(set font to COURIER NEW to view the diagram properly)

Position "1": (straight through)

Exciter >--------------< Antenna

Tuner Out >--------------< Tuner In

Position "2": (cross-connected)

Exciter >-----+ +-----< Antenna
\/
/\
Tuner Out >-----+ +-----< Tuner In

I know B&W made one, because I used to have one of theirs, and I'm sure there were others too. I need one with SO-239 connectors. I've heard that someone made coaxial relays to do this same thing, and one of those would work also.

Source record: 57827

I have for sale a Zenith Transoceanic Model 8G005YTZ1. This is in need of restoration, and is mostly complete except its missing the knobs and a couple of push-buttons. I bought this to restore, but have'nt gotten around to it and I don't have the room for it anymore. The condition is Fair, the wavemagnet is in pretty bad shape and you would probably need another one if you were going to do it right. I have never tried to power this one up but was told it was working when I bought it. I would like 80$ + shipping and that is already less then I payed for it so no bargaining please. It is of course sold as-is and I cannot guarantee that it will work, sorry.

E-mail if interested: t41@optonline.net

This is an exceptionally clean R-390A in original condition. It has never been modified and is in excellent condition mechanically and electrically. The gear train looks completely clean and the VFO endpoints are linear within 300 cycles. I retubed it and performed a complete alignment a little over a year ago. It has not seen much use since then, but I just checked it out and it is working flawlessly. This Radio was built by Amelco under contract 35064-PC-62. The serial number is 2204. It is very clean on the inside, and is complete with top and bottom cover.

If it was " original ", it would have a Progressitron Corp. pto, not a
Cosmos pto. Just thought you would like to know.

143. Open & Closed Impedance Measurements

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-01-05 19:30:28 UTC
From: Reg Edwards <g4fgq.regp@btinternet.com>
Message-ID: <9357s6$i9p$4@plutonium.btinternet.com>
Source record: 57752

NEW PROGRAM: ZOC_ZSC.exe

Measure the input impedance of that unknown length of coax or twin-line, first with the far end open-circuit and then with the far end short-circuit, to obtain Roc + jXoc and Rsc + jXsc. Then enter the measurements into program ZOC_ZSC along with frequency and measured length of line.

Output data: Zo, Angle of Zo, Attenuation dBs, electrical length in wavelengths, VF, wire loss, ohms/m, mhos/m, uH/m, pF/m.

But to obtain more than just Zo and dBs accurately very accurate measurements are needed. Best to avoid extremes of impedance at whole numbers of 1/4-wavelengths. Measure at frequencies where line length is approximately an odd number of 1/8th wavelengths.

The Zoc/Zsc method can be used to determine the transmission characteristics of any 4-terminal network used between its image impedances.

Download ZOC_ZSC in a few seconds from website below. 41.4 kilobytes. Run immediately.

We used to call it Mother F***ing Paint in the repair depots as the
film was somewhat of a thermal insulator and was initially difficult
get solder to melt under the stuff.

I always thought it gave surplus equipment a characteristic odor only
us boatanchor enthusiasts could love.

Have a super nice 1051B restored in May of 99 for sale. 2-30mcs.
AM-CW-FSK-LSB-USB-ISB. Decadic knob tunning. Not a band cruiser but perfect
for utility monitor or cal . receiver. Incredible specs. and construction.
Was used on ships and subs for crypto work and it replaced many R-390 series
Collins receivers in the 60's and 70's
Have manual and couple of spare modules with it. Front panel and knobs
perfect. Cabinet Very good with respray of Navy flat grey. Unit in top
condition compared to most I've seen. Pics avail... 350.00 + u ship from Ma.
or pick up. Unit is heavy...

This sure brings back memories - I built a Heath AR-2 kit in the summer
of 1954 and used it to copy K6USN code practice. It helped me get my
13 WPM and General ticket. I remember there was one tie point under
the chassis that just wouldn't wet with solder and I finally wound up
using soldering paste on it -- probably fallen apart by now. :^)

TCNET058@ysub.ysu.edu wrote:
> Anyone know where I can get a 3RP1 CRT? This is the tube used
> in the Heath SB-614.

I bought one last February 2000 from Pat Croft (W9GTA)...he had new Hitachi 3RP1As in stock for $45 plus shipping. I bought one for my Heath HO-10 and was very pleased. These 3RP1As are the flat-face variety, particularly made for instrumentation purposes.

Pat's email address: mai@iquest.net
phone: 317-257-6811

He can ship UPS Red, Blue or Ground

Be warned: there are several versions of the 3RP1A; the Dumont is missing pins 5 and 11, and is 9.25" long. The Hitachi, on the other hand, has all the pins and is 9.00" long. So- if you're space limited, you should buy the Hitachi (also has perfectly flat face) - the Dumont is slightly rounded. I'd certainly give Pat a try if he's still at the above email address.

173. SWAP: AVERAGE 51J-4 for PERFECT SX-25

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-01-06 15:23:03 UTC
From: Bob <takin@the.fifth>
Message-ID: <t5ee4m3s5engb6@corp.supernews.com>
Source record: 57783
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.swap

I have an average Collins 51J-4 with two of the three filters (missing 800Hz the filter), some blemishes but works well. PTO alignment is off a tad at the ends and a product detector circuit has been added but could be removed, no holes drilled anywhere. I want to swap this legend for a perfect Hallicrafters SX-25 with correct speaker. Perfect as in like it came out of the box yesterday! I am not interested in any other swaps or money, thanks. You would also pay for all shipping but I think this would still be a good deal for both. If interested reply to (spam denied) p15218 AT peolplepc DOT com. I'll try to take some JPEGs of my 51J-4 in the next day. I am located near Detroit, Mich.

I haven't been active in over 30 years and I really need some more space in my condo. After some soul searching I've decided that it is time for me to move on and part with the gear I loved while I was growing up in the 60s.

The following items are for sale as a package deal:
Viking II Transmitter with 122 VFO
Hallicrafters SX-110 Receiver
Knight P2 SWR/Power Meter
Ameco 6 Meter Converter
Field Strength Meter
Skillman Semiautomatic Key
Spare Tubes
Crystals
Misc. ARRL Publications

Price $350.00. pick-up only
Please e-mail me at Jaybee727@aol.com for a complete description of the articles.

Thanks,

Jerry B.

1) 34 un-edited jpegs are at http://pierfelice.webprovider.com/images/51j-4/
in no particular order
2) I have the correct knob for the antenna trimmer, the large one is just
easier to use.
3) Don't have the correct main tuning knob, only the spinner
4) I checked the sensitivity and using the 51J-4's meter in output mode, AM
= about 1uV for 10dB S/N, with the product detector on it is about 0.3uV for
10dB S/N for a CW signal. Spot checked both at 5,10,15,20 and 25 MHz.
5) The side panels were painted tastefully with grey hammertone at one
point.

195. EICO 753 question

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-01-07 03:18:11 UTC
From: clemlaw@my-deja.com
Message-ID: <938n5g$n8a$1@nnrp1.deja.com>
Source record: 57655

I just became the proud owner of an Eico 753 transceiver and have a couple of observations, and a request for help.

I haven't been on the air much for a long time, and got this so that I would have *something* for HF. Also, I wanted something to take on an upcoming trip, and wanted something that I could afford to have broken or lost. The 753 looked like a good candidate.

When I first fired the rig up, it didn't really want to tune up, but I did the best I could, and made numerous calls with no avail. Surprisingly, a W7 eventually heard me, but he lost me before we completed a QSO. I was about to give up on the 753 in disgust, but I decided to open up the cabinet to see if anything was obviously wrong. And there was. For some reason, the plate caps were disconnected from both tubes in the final amp. Reconnecting these made a great difference, and I was actually able to tune up the rig, and it put out a signal. (I have no idea how I previously managed to put out enough RF for the W7 to hear my call.) Only a tiny amount of smoke could be seen coming from the final amp, and I presume this was just an accumulation of dust, etc., being burned off.

I worked a few QSO's, on both CW and SSB, and received good reports. I was, of course, told that I was drifting, but I explained that the 753 was *supposed* to drift. (This rig was affectionately known as the "Seven Drifty Three", I learned.) I managed to work an F and a CM on 40 CW with a haphazard dipole a few feet off the ground. (The drift, of course, didn't bother the CM!)

Moments after I signed with the CM, both the receiver and transmitter went dead. There is some background noise with the receiver set to SSB or CW, but there is almost no sound with the receiver on AM. I did notice that one of the tubes, which had formerly been glowing bright purple, was now completely dark.

Further investigation revealed that this was a 0B2 voltage regulator, and appears to supply a steady voltage to the VFO.

I've ordered another 0B2, and I'm hoping that replacing it will be all I need to get the rig back on the air. My question is whether I am being unduly optimistic.

First of all, is this a normal failure for this type of tube? Does this type of tube just suddenly stop glowing? Unfortunately, I don't have any test equipment readily available, but this tube is fed right off the B+ through a 10 watt resistor which looks like it's still in good condition.

My second question is whether anything else would get fried when this tube fails. Since we're talking tubes here, I assume not, but if there are any precautions I should take, please let me know.

Also, if anyone in the Minneapolis/St. Paul area has a 0B2 tube they'd like to sell, please let me know. I'm not very patient when it comes to waiting for parts to come in the mail.

I appreciate any insights you might be able to offer.

I suspect the B+ went dead. The tube wouldn't glow purple without
the B+ present. I'm sure they fail, but I've never had a bad one!
The way these things are normally tied in is somewhat like a
ballast in parallel to the rest of the circuit, to pull a varying
load across a resistor depending on fluctuations of the main B+.
The B+ would still be there even without the tube, although at a
higher voltage.
All that said, I doubt there's any damage beyond whatever crapped
out in the PS section that has caused you to lose B+.
As for the drift, yep the 753 shoulda had that emblazoned on the
front panel. To boot, they pushed it also as a MOBILE rig!
There's a number of mods in the old magazines (early 70s 73
Magazine, etc) to help tame this beast. I recall hearing some
nice sounding 753s back in those days.
Good luck,
Bill WX4A

I'm looking for supplemental tube data for the Heath TT-1 Tube Tester.
If anyone knows of a possible source of info, please email me.
I'd also like to get a copy of the schematic for the TV-7, so I can
contrast the two testers.

This is another project that I'll probably never get to......

This radio is quite clean and will probably take little effort to bring back into useful service. Cosmetically it is very good but the hinged cover needs a bit of TLC. Electrically it is unknown as I do not have the facilities to test it. For an external 12VDC power supply to be usable it requires a 3/16" tip telephone plug which I don't have so I cannot power it up. I don't know much about this radio and so I feel it would be better off in the hands of someone who does.

I would like to get $100.00 plus shipping for it. I have seen other examples sell for $200 and up on ePay and other auction sites. If interested please reply by e-mail.

Coredially,

Michael Crestohl

I have a fairly nice Zenith Trans Oceanic 600 series radio with the
black leatherette case and the slide rule dial. This one's in need of
some minor restoration including a new dial cord but it is complete
and all original.

I am asking $85.00 plus UPS for this fine piece. If interested please
reply by e-mail.

> was *supposed* to drift. (This rig was affectionately known as
> the "Seven Drifty Three", I learned.)

The drift was bad in the early models, which had a tube-type VFO. This was greatly improved by replacing the tubes with a solid-state VFO, like the one in my later-model 753, and although it still drifts a bit when first turned on, once it stabilizes it isn't too bad. It's a nice unit, and was a great value for what you paid, like all the Eico products.

Message-ID: <3A5881B0.A8393536@wbns.com>
Source record: 57668

I would suspect the VR is not bad. It is a gas regulator and needs voltage across the tube to operate. I suspect you have a failure, short to ground, somewhere on the B+ line, thus pulling the B+ voltage lower than that needed to cause the tube to conduct. Pull out the VFO tube to start and see if the VR lights again. If you had just a open VR the radio would probably work but the VFO would really drift as opposed to normal drift.

Romove one tube at a time and watch the VR tube, if it lights you found the shorted tube. Howver, more than likely you have a shorted bypass cap somewhere and will need at least a VOM to find it.

additonal info. FYI
There was a solid state VFO kit made to fix the drift. However, it had a tendency to FM which was worst than the drift. The solution is to find a parts 753 with a Solid state VFO. swap it into your radio and then using modern regulator chips, fix the FM. But that a later project, HI

I am still restoring some old BC-312/342 receivers to their "original" condition. The "jewel" being a 1937 1st production unit.

I am looking for junk receivers that I can use to strip off hardware and cosmetic pieces. I am missing knobs, output jack "flaps", even the "ugly" connector on the front panel-- which every ham mod book said to remove.

If you don't have a chassis, please look in your junk bin for pieces you might be willing to give up. It would be really nice to find a DM-17 dynamotor or even a dead DM-21/RA-20.

I will be going to the big ham fair up here, but it isn't till March. I am sure that those big junk boxes will have some stuff to find.

I don't have much old radio gear to trade, but I have lots of new stuff-- RF, DDS and analog circuits-- that can be traded. Of course, I can always use money.

Thanks again.

Steve.

After viewing the interminable threads on r.a.r+p regarding wholesale replacement of capacitors (pro and con), I decided to conduct an experiment on a Hallicrafters SX-16 I just bought. While this receiver is much more complex than most radios a newbie will deal with, the techniques are directly applicable. I'm offering this in the hopes that someone can learn from my experiences.

While in great physical shape, the old buzzard didn't work too well, had a bunch of ham-special modifications, and the top two bands didn't work.

The first effort was to get rid of a product detector and a cathode follower for the mixer (most likely installed so a panadapter could be connected). The receiver performance was then re-evaluated - it was almost dead on the formerly working bands.

I decided to take it stage-by-stage. I performed a quick IF alignment which improved things somewhat. Below is a list of problems identified and the actions I took to correct them:

Problem: low sensitivity. Verified as IF problem by injecting 465 KHz into mixer grid.
Solution: bridged new bypass caps one by one across the existing cap in the IF. Each made a significant improvement, so all bypass caps in the IF went over the shoulder. Re-aligned IF - now a huge improvement.

Problem: distortion on medium/strong signals
Solution: leaky bypass caps in the AVC and coupling cap to the first audio replaced. 3 resistors that had increased in value about 50% were replaced. This also cleared up a low=level oscillation in the AVC circuit only noticible on the dead bands.

Problem: "chyellowy" tone
Solution: bypass electrolytic for first audio dried up. Replaced cap.

Problem: intermittent operation on band 4, dead on bands 5 and 6
Solution: Replacement of a weak 6J5 local oscillator cleaned up bands 4 and 5. 6 still dead.

Problem: Band 6 (32-61 MHz) dead
Solution: removed ham-special mod intended to use band 6 as bandspread for 6 meters only. A lot of trial and error winding a new coil and messing with the LO adjustments finally brought it pretty close.

Problem: low S-meter reading
Solution: screen dropping resistor for S-meter amplifier tube had increased from 100K to 170K. Replaced resistor.

Problem: loss of sensitivity when warmed up
Solution: screen supply voltage for IF tubes drifted downwards. Re-wired screen supply according to schematic (someone had put a huge wax .2 uf cap across the screen supply resistor which leaked when warm, causing drop in voltage. Installation of the cap also caused an intermittent in the wirewound dropping resistor).

Problem: still loss of sensitivity when warmed up
Solution: cleaned dirty adjustment cap in IF can

Problem: overload on strong SW signals
Solution: Ham-special mod to increase apparent sensitivity of the RX. The first RF tube, a 6K7, had been replaced with a 6SG7. AVC had been disconnected from grid of first RF tube. Grid was now connected to the RF gain network, causing first RF to run wide-open all the time (unless the RF gain was turned down). Re-wired according to schematic (but left the 6SG7 and its wiring intace due to "pain in the ass factor" in putting it back the way it should be)

Problem: low sensitivity on bands 4,5 and 6
Solution: bypass caps for mixer and first RF ineffective. Replaced.

Problem: Dead(?) BFO
Solution: Adjusted BFO set capacitors which were far enough off that no tone was apparent. The clue here was that "white noise" increased when the BFO was turned on. Suspect that addition of the product detector loaded the BFO enough that the adjustments had to be radically re-set.

Conclusion: I would have saved a LOT of time had I just gone and replaced ALL the paper caps in this receiver. It takes 2 minutes to replace a cap (except for those nasty ones in the RF section) but took from 10 minutes to an hour to track down each problem these caps presented. I also know that the new caps aren't going to crap out (which usually happens only when you're going to demo the receiver for visitors).

Notice I *didn't* test tubes wholesale unless a problem was suspected with a particular tube. The only tubes tested were the 6J5 (clue here was it worked FB on lower bands but crapped out at higher frequencies) and the 6F7 S-meter amp (which, although weak, still had enough emission to perform adequately). Verification of the problem in this case was strictly by VOM; I tested the tube after the repair out of curiosity.

Also, you;ll notice that as some problems were fixed, others became apparent. The AVC problems and overloading became apparent only after the IF gain was up to scratch.

Bill = yes I did, with my HP digital L/C/R bridge. This reads out directly in microfarads as well as dissipation factor (a function of series resistance) and will also read up to 20 megohms.

Almost all of the caps I replaced were both leaky and had changed dramatically downwards in capacitance. As you know, a somewhat leaky bypass cap won't cause the huge upset that a leaky coupling cap will. 10 megohms of leakage in a coupling cap is the kiss of death, whereas this is pretty much un-noticeable in a screen bypass or cathode bypass.

However, when the capacitance changes (and some marked .05 uf caps tested at 700 pF!) they become completely ineffective for bypassing and their equivalent series resistance seems to go way upwards in value as well. The 700 pF reading may be an artifact of the LCR bridge seeing an extremely high ESR value.

THe 10 uF first audio bypass had decreased in value to .3 uF.

Great post, John. Now I guess we'll have to give equal time to
the guy with an ole rig with all original caps that he swears
still works perfectly.
One observation though...You mentioned bridging across the old
bypass caps and noting the improvement. That sounds like their
capacitance value having changed was a bigger problem than the
leakage which is typically expressed to be the major concern. Did
you check any of these components afterwards specifically looking
for "cause and effect"?

If the filament string is powered by the AC line (rather than through a transformer), you can use the Westinghouse "instant on" trick.

Connect the string directly to the line through a silicon diode. Then add a contact on the power switch that shorts out the diode when you turn the radio on.

This system not only prevents inrush, but it keeps the internal temperature more-nearly constant.

224. FS - Motorola Signal Generator

For Sale

Motorola Signal Generator. It is the size of a URM-25 and uses tubes, but I do not have the model number.

FM and CW.

Output Frequencies:

Band A 25 - 32 mhz.
Band B 32 - 41 mhz.
Band C 41 - 54 mhz.
Band D 132 - 175 mhz.
Band E 400 - 470 mhz.
Band F 890 - 960 mhz.

Also has the following separate and adjustable if output:

3 - 4 mhz.
4 - 6 mhz.
6.8 - 9.4 mhz.
69 - 78 mhz.

Output adjustable from .1 uv to 100,000 uv.

Price is $50 plus shipping from Portland, OR.

Colin K7FM

225. Radioactive Tubes

Newsgroup: rec.radio.amateur.boatanchors

Message-ID: <3a58e9f1_2@newsa.ev1.net>
Source record: 57683

Came across a JAN-OA2WA with a Nuclear Insignia. On the tube it says " THIS TUBE CONTAINS LESS THAN 0.03 MICROHENRIES OF KRYPTON-85".

..and ohhh my gooosh - yes - this OA2 -DOES- glow in the dark! - Which naturally begs the question - How many OA2's are needed to reach critical mass?? (Just kiddin !)

Any one else seen radioactive tubes? This is the first one I've seen. Don't see any difference between it and a "regular" OA2 in a B+ circuit.

Just curious is anyone knows the reason for the warning? And why Krypton-85 was used? (other than to keep Superman away from the power supply section.HIHI)

-Biz WD0HCO

I gonna cross - post this on the antiques.radio+phono UG to see if anyone there knows as well.

Thanks for the info everyone. After reading your replies, instead of waiting for the tube to come, I did do some checking, and sure enough there was a short to ground after the regulator. This was drawing it down to only a couple of volts, and so obviously the VR wasn't firing.

The short turned out to be in a shielded cable leading from the VFO plate to, I think, a mixer stage. It passes right next to a resistor that had apparently been overheating, and this melted the insulation causing the short.

With the help of a friend of mine (who owns an operating VOM and soldering iron, which I don't at the moment, and who is better at using them), I tracked down the short.

After this fix, the rig seems to run fine. It still drifts, of course, but after an hour or so of warmup, it's tolerable. I worked a number of QSO's this afternoon on 40 and 20 phone and CW, and got reasonably good reports.

Thanks again for the help everyone. And if you hear me drifting through 40 or 20, give me a call!

Hi
Any tube that has a Tantlum plate will register on a giger counter.I have been told that Thoriated tungsten is mildly acticve also.These statements are from a enginer at Eimac.
Another interesting thing I found out was that the glow off a 872 rectifer is harmless .
The man at the x ray divison told me that the voltage is to low to produce hard x rays.
This meaning that at low voltages less than 10kv . The x rays cant make it out of the glass envlope.

Absolute, total, and utter crap. Another piece of urban-legend phony-baloney. Ain't true. Never was, never will be.

There is NO WAY, WHATSOEVER, that keeping the filaments on at half-power can cause overheating. Period.

When was the last time you saw or heard of a vacuum-tube electronic device -- of ANY kind -- starting a fire WHILE IT WAS OPERATING? It's very rare. And an instant-on product generates a lot less heat "idling" then it does when on.

A classic example of believing something that's fundamentally "impossible" just because you heard about it from some "expert."

The Krypton 85 is included in Voltage regulator tubes to promote
ionisation - start-up in other words. The military used them frequently.
There was also a class if discharge tubes used by the military intended for
lightning protection that were radioactive.

Best part of that exercise was that you and your buddy were doing the real ham radio thing by troubleshooting and then....making it work! (and of course twice the fun after using it again!). 753's were an entirely useable radio....and to those impatient (or in all fairness - new to radio) persons were a curse not to receive a kind word. Good friend of mine bought one for 40 bucks at a fleamarket couple of years ago....we got it working that afternoon and had a ball for over a year with it - hard to beat the value.

Source record: 57694

Some gaseous VR tubes contain a small amount of radioactive material, to maintain a minimum ionization level in the tube, which helps stabilize the striking voltage. Some neon bulbs contain it, too. Without the radioactive source, gas tubes are subject to a phenomenon called "dark effect", which is a significant chamge in striking voltage dependent on ambient light levels. The Kr-85 was mostly used in JAN rated VR tubes. Some manufacturers used a small amount of radium as an ion source. Krypton had the advantage of being a gas, which was simply mixed with the other gases used to fill the tube. A radium source was a small piece of metal, which had to be spot-welded to some part of the tube structure.

872s may produce soft X-rays, but only if operated at voltages over 10 kV. Another potential pronblem is the large amounts of UV radiation that the mercury vapor discharge produces. Most of this is absorbed by the glass envelope, but there may be some cause for concern if you spend a lot of time exposed to the blue glow.

Sorry, paid my way through last two years of college working as a technician for a lawyer/professor team making lots of money from fires caused by instant on TV sets. Almost always caused by something other than the filament circuit. We won large damage awards against RCA, Curtis-Mathis, etc. by taking TV sets of the same age and having them start fires. I like to think I was instrumental-- at least in a small way-- in getting rid of these crappy designs.

Funny thing though. Spending lots of time in court and with lawyers didn't create a great respect for them.

Agreed. worked on a couple of those 'Instant On' TVs years ago.
Just did a quick calculation of how much electricity was consumed by the tube filaments in the 'OFF' condition of an 'Instant On' TV.
Series Heater string 0.15 amps. 120 X 0.15 times one half = 9 watts when 'off''.
Series Heater string 0.15 amps. 120 x 0.15 = 18 watts when 'on'.
And even with tubes using 0.3 amps when on 120 X 0.3 = 36 watts.
Hardly a furnace!

>Hardly a furnace!

The fires originated most commonly in the phenolic wafers used in the
cheap switches used to control the power. Also, it isn't the total
power that matters it is the constant supply of energy. Lots of
carbonization. Second worst violators were the first circuit board
sets.

Not "crap," but a real menace to public safety in the 60s and early
70s-- and I only completely familiar with the Seattle cases.

If you study UL and other safety specs you will see evolution of things
like "carbon tracking index," etc. developing out of these early
problems. The engineers designing these products did the same
incorrect analysis as that above. The numbers are right, but tell you
nothing about the problem.

Product safety is a hard design task and is sometimes easily overlooked
by otherwise excellent people.

Steve.

247. Realistic 105 tube tester docs needed

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-01-08 06:52:01 UTC
From: Mark Van Nordstrand <mavn@www.com>
Message-ID: <c6bi5tog2oha37eeqfo5224o2bebehe2n4@4ax.com>
Source record: 57711

Another big win on Ebay 3 years ago. Still wandering through the desert searching for a tube chart.

I received this from Walt Belsito (a good document source) :
Subject: Re: tube tester manuals
From: k1rts@juno.com (walter j belsito)
Date: Wed, 15 Apr 1998 06:31:38 EDT
The actual model number for the R / S is TK 105 (kit) , stock nr 22k94lo61 and TW 105 (wired) , stock nr 22k94lo62 . it was made in 1960 / 1961 . original cost $15.95 for kit and $19.95 for the wired version . 73's for now . WALT / K1RTS

And this from Tandy:
Subject: RE: Realistic 105 tube tester new info.
From: RSPSC1 RS Store POS Mail user <RSPSC1@tandy.com>
Date: Thu, 16 Apr 1998
We have no owner's manual for this item. The best we can offer is the catalog page from the 1963 Radio Shack catalog.

This is a great little tester, need tube chart to use it.
Thanks in advance for any help.
Mark Van Nordstrand in North Hollywood, CA

Good Evening:
I have a very clean SB-230 Heathkit amplifier for sale.
This rig has been gone over and the only modification was a replacement of
the RCA jacks to PL-259's.
I only drive 28-30 watts on this unit. I baby this unit.
$400.00 + shipping
No manual.
This was my amplifier this past year.
Upgrading to new equipment.

Good Evening:
I have a Swan WM-2000 Wattmeter for sale.
The unit is clean with the exception of some minor nicks of paint on the edges. It has been in daily use the last 3 years.
$50.00 shipped
I am upgrading equipment.

250. BA Feet

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-01-08 07:49:26 UTC
From: Chris Kepus <ckepus@no.spam.calweb.com>
Message-ID: <01c07947$830ed480$5751d3cf@chris>
Source record: 57709

I need to find a source for some new feet for my Boatanchor. The originals were cylindrical, 1 5/16" dia., 1 1/8" tall, drilled center hole to accommodate a 10-32 screw, and a counter sunk area 1/2" in dia. to allow the head of the screw to be recessed. These feet were originally a brittle plastic (kinda like Bakelite) with a somewhere between a flat and satin black finish. I am looking for replacement feet that are either machined aluminum that could be powder coated or a nylon-like plastic that can be machined and has the requisite (or close) black color. Any referrals out there? Please reply to this message by deleting "no spam" from the email address.
Thanks es 73,
Chris

Good post. I recently completed a total recap and re-resistoring of
one of my favorite SWL broadcast receivers. An SP-600-JX-17.
Have restored and used quite a few, but this is the first time I
shotgunned the whole thing. It's a time consuming process.
The result?
There simply is no performance comparison between one of my
"worker" SP-600's, and the receiver with fresh components.
I have now experienced how REALLY remarkable the silky
smooth tuning and sound these behemoth receive engines
are capable of producing. Makes my $4000 DSP Icom box sound
like a table top clock radio.

"Almost always caused by something other than the filament circuit."

Thanks for setting the record straight. Some of these sets might have caught fire, but it was NOT the instant-on feature that caused it.

Again, thanks for clarifying the situation. It was bad design, not the instant-on feature itself, that caused the fires.

With respect to sets with printed circuits... Zenith had been promoting hand-wired, "hand-crafted" sets for years. "Hand crafting" is a lot of baloney, but Zeniths were well laid out and a pleasure to work on (unlike the rats-nest wiring of virtually every other brand).

Zenith had the public convinced that printed circuits were inherently inferior to hand wiring. (It was probably true at that time.) To counter this, companies (like Westinghouse) had to offer extended warranties on their PCB sets.

John, you've shown remarkable skill (and logical troubleshooting techniques) in running down the Hallicrafters problems. This is precisely the knowledge and skill that many newbies (I also hate this word) are trying to acquire. Shotgunning old radios is the best way to get from a non functioning unit to a safe and pleasant radio. But all that people like Jim Bailey will learn from total, immediate recapping is higher proficiency with a soldering iron. Through fairly decent technique, he's identified the osc isn't running. Should he conquer this problem first, then recap later, he will learn so much more from this single experience than he will from any text. Many newbies here just want to get grandad's radio running, and the best thing for them to do is to recap. But there are others (like Jim), who want to know more; they've taken the time to follow Bill's course.

BTW, I would have thrown that Hallicrafters away!

John, it seems likely that the set probably would have actually worked
on most bands if there had been no mods and the 6J5 was replaced; not
very well, but worked. This is an excellent presentation as to the
effects of ageing components on set operation. It demonstrates that the
caps, while not obviously defective, are still incapable of performing
their circuit function properly. Yes, some resistors were out of
tolerance, and needed replacement, but here again, the set works (to a

degree) with the deficient parts. Bringing the components back up to the performance expected by the designers is essential if the set is expected to function as intended.
This is why I have turned 180 degrees from 'replace as necessary' to wholesale replacement of the paper caps, if a few samples show less than perfect.

John, while I understand what you are meaning, what John went through
on the Halli is, as he says, an unnecessary exercise in trouble
shooting. Especially for the neophite! In the typical 'repair'
situation, you are searching for a single fault, or, at least, a single

'root cause'.
To have numerous failures scattered throughout the system makes systematic analysis essential, and, as John demonstrates, a clear understanding of the operation of each circuit is required to be able to interpret its functionality.
Replacing ALL the paper caps removes them as potential troubles, and testing the tubes decreases the likelyhood of them being a problem, so the defects are then reduced to the resistors (best tested while replacing the caps), inductors and mechanical parts (switches, tuning caps, etc.). The defect(s) (if any remain) is now more likely to be found by the "newby".
John's approach is indeed an example of what a skilled technician would do to test out a piece of older equipment and restore it to proper operation, but this level of expertise is not something to be expected from anyone not having many years of experience.

Lets see, to have the instant-on feature other components had to be added, which due to design flaws sometimes caused the sets to catch fire because there was always some power on in the set. Sets without this feature seemed to be OK. Yep had nothing to do with the instant-on feature.

Hello.............NG
Delivery & Pick-up.....!!!!
Anyone need any....(Pinball Machines, Tape Decks, Organs, Pianos, Radios, TV's
Consoles, Mixers, Speakers, Jukeboxes, BOATANCHORS...of any kind. Anything BIG.)
Handled with TLC.....
I will be traveling out West in the next three weeks.
I'm leaving NW Pa. early next week. first to NYC. & New England.
Next down the East coast to Atlanta then Fla.....
Then depending on "weather" across the Mid. or South to TX. Las Vegas & West coast.
All the way from San Diego to Seattle....
After that Back....East.
Let me know...
Thanks.

I have some high voltage plate cap connectors, Alden p/n 91CCSTLRL.
These are a good snug fit on a 6146 or similar size sweep or HV
rectifier tube. (These are probably not meant for power tubes). Cap is
hard red plastic with a 4" long rubber HV cable coming out one side, and
has a soft red rubber skirt about 1-1/2" dia that extends down about 1"
to fit over the outside of tube at the top. Each is still sealed
in original foil wrap and boxed, mil surplus. $1.75 each or 4/$6. plus
shipping. Please REMOVE the "05" to reply or call 334-347-5281 day/eve.

Absolutely. The use of poor-quality components does not mean the feature itself is dangerous.

The implication of your statement (following my recommendation of instant-on) was that the instant-on feature ITSELF caused the fire -- which it did not.

The belief that instant-on, itself, causes sets to catch fire, is completely UNTRUE.

GE would no doubt say it was for the lifetime of the board...!

If the board were well-constructed, it would probably outlast the rest of the set -- especially a
vacuum-tube TV.

The scans are not bad. Even the oldest are useable and print quite nicely. Unfortunately the format seems to be propriatory so if you want an electronic version you have to do a "print screen" and then paste the results into a graphics program. You loose a lot in the change and it becmoes a lot of work

The software is at best poor. I wish there was a better program to use. The search feature is cumbersome and not at all intuitive. Small things are a pain. If you want to do a wildcard search, then you HAVE to use the asterick on the top row and not on the number pad.

All in all handy but seems to be the result of a "low bid" project, or someones brother at the ARRL who needed a job and knew a little bit about programing got it.

I don't know how you possibly read that into my initial post. My statement was * And the "instant on"
tv's that used this trick were known for burning down houses.*
to which you responded that was simply not true. It is known that sometimes sets with this *instant
on feature* installed were prone to catching fire I never made any comments as to the reason why.

Message-ID: <3a5a8a11_2@newsa.ev1.net>
Source record: 57598

I got the whole set.

All scans are in standard TIFF format. File titles are page numbers under a month subdirectory for a given year. Any program capable of reading TIFF files can be used to see the files. The display/database program given on CD is for Windows only but I use a graphic converter program so I can use the CD with an iMac.

The program is also a database so you can search by date, name, call, or title of article. It's not fancy and take some getting used to. Printing is a pain. Far better to use a converter program and change it to JPG format to cut and paste what you want.

The set is uses TIFF from 1915 to 1994 vol.

After that (1995) they changed the program and file format (unknown) to support color and hypertext. Now they only have articles but no advertising or letters to the editors, or other neat misc. items.

In MY opinion - that was the fun part!

Also if you have a laptop with a big hard drive - you can download a whole CD or two and take it with you.

Does anyone know about the Maxcom high speed antenna matcher? It is rated at 1000 watts PEP from .1 to 200 Mhz. It is a small box (center insulator) 3X4X2 inches. It is a passive device. I have been told it is the matching unit of choice for the CIA. It presumably will offer a good 50 ohm match from it's SO-239 connector when random lengths of wire are connected to the two porcelin dipole posts. Does anyone has info or history on it. I know nothing. Thanks! Jack k8xx

Hammarlund HQ-140X general coverage shortwave receiver to swap for something interesting. What do you have?

This receiver comes with a commercially-produced reproduction of the manual. Cosmetically the receiver is an "8" with some age spotting but nothing that I would consider rendering it unattractive given its age. The receiver is still in its beefy steel equipment case with the two military-style handles on each side. The crystal filter and BFO work very well. In fact, I have been using it regularly to operate on 80 CW nightly as well as listening to shortwave. During the past week I have received excellent signals from the BBC, NHK Tokyo, Radio Taiwan and TWR in the Netherlands. Even so, the receiver needs a good alignment and some contact cleaner to its bandswitch. All tubes have been checked and I replaced three, so all are "Good" according to my solid state B&K Tube Tester.
The HQ-140X was purchased from a ham dealer who sold it "as is" due to its "power supply problems." Investigation revealed that the 5U4 rectifier shorted and drew enough current to open up the 5 volt secondary winding on the power transformer. I judiciously peeled back some of the waxed paper and reconnected the open winding and the receiver fired right up. In 1969 I performed an identical operation on an Eico 720 and the transmitter is still in operation today, so I have confidence in such repairs not degrading the transformer integrity.
Shipping weight will be 53 pounds and I can ship it 2nd day air via FEDEX for less than UPS Ground due to a special arrangement that I have through my employer.
I will be happy to email a JPG of the HQ-140X if you are interested and if I am interested in whatever you've got to trade. Obviously I am particularly interested in boatanchors (transmitters or receivers) although I might consider a swap for a Century 21 if the mood hits me right. :)

Hammarlund HQ-140X general coverage shortwave receiver to swap for something interesting. What do you have?

This receiver comes with a commercially-produced reproduction of the manual. Cosmetically the receiver is an "8" with some age spotting but nothing that I would consider rendering it unattractive given its age. The receiver is still in its beefy steel equipment case with the two military-style handles on each side. The crystal filter and BFO work very well. In fact, I have been using it regularly to operate on 80 CW nightly as well as listening to shortwave. During the past week I have received excellent signals from the BBC, NHK Tokyo, Radio Taiwan and TWR in the Netherlands. Even so, the receiver needs a good alignment and some contact cleaner to its bandswitch. All tubes have been checked and I replaced three, so all are "Good" according to my solid state B&K Tube Tester.
The HQ-140X was purchased from a ham dealer who sold it "as is" due to its "power supply problems." Investigation revealed that the 5U4 rectifier shorted and drew enough current to open up the 5 volt secondary winding on the power transformer. I judiciously peeled back some of the waxed paper and reconnected the open winding and the receiver fired right up. In 1969 I performed an identical operation on an Eico 720 and the transmitter is still in operation today, so I have confidence in such repairs not degrading the transformer integrity.
Shipping weight will be 53 pounds and I can ship it 2nd day air via FEDEX for less than UPS Ground due to a special arrangement that I have through my employer.
I will be happy to email a JPG of the HQ-140X if you are interested and if I am interested in whatever you've got to trade. Obviously I am particularly interested in boatanchors (transmitters or receivers) although I might consider a swap for a Century 21 if the mood hits me right. :)

The Maxcom is a balun and a swampng resistor potted inside the nice box. There might even be some pieces of lead shot, nuts, bolts as well, to give it added weight. We evaluated it for the USCG back in the early 80's and tore it apart. Found a 50 watt ceramic resistor and a bunch of odds n ends potted in white silicone goop. We must have gotten an earlier one, when ARRL examined theirs it was potted in epoxy.

In one sentence: DON'T WASTE YOUR MONEY IT'S A GIMMICK

Snake oil at its very best. I can't remember any other product marketed to hams that was a bigger rip-off.

QST wouldn't advertise it. 73 used to, but I don't know if Wayne still does since I quit reading 73 a while ago.

K1TD at ARRL did a product review of the Maxcom in the November 1984 QST. They even printed X-ray photographs of the guts. And the 1984 listed prices: $600 for the 200W version, the 500 watt version $800, the 1000W version, $900, 2000W version $1000.

If you're an ARRL member check out
http://www.arrl.org/members-only/prodrev/pdf/pr8411.pdf

They x-rayed the sample they were given for evaluation and returned it to "the would-be advertiser"...

You're trying to have it both ways. You can't ignore the context in which you made that statement.

My original post suggested adding instant-on to existing tube radios to increase the life span of their
tubes (and possibly the rest of the radio). By responding that instant-on TVs were known for burning down
houses, you implied that readers should not do this, because their modified sets will also catch fire.

BH wrote:

Bill,

I have most of the QST View CD-ROMs, and I think the readability is just fine both on the screen, and when I print out the articles.

The best part about the QST View is that once you have loaded the "index" of articles during start-up (e.g. for the 1940-1949 CD, or the 1950-1959 CD), you can easily search for all the articles on a particular topic or author.

For example, if I search on articles about *Heathkit*, it comes back with 48 hits, and then it tells you which year CD to insert for a particular article that you select. Likewise, for *DX-100*, it comes back with 19 articles (you have to click on the open folder icon at the top to see the complete listing.). And if I search for articles by last name Grammer (George, W1DF), it shows me the listing of all 261 of them.

So I think it is a great resource. Hope this helps.

I don't think this is a good example for "n******". In fact, if I were looking into trying to repair my first radio, I would probably be horrified and decide to take up another hobby.

Most radios that "n******" would try to repair are simple broadcast band or BC plus one or two SW bands with much simpler circuits. Checking tubes and replacing capacitors gets about 90% of those sets back up and running. Replacing a few resistors will get the remaining sets working. All that's left is a tune-up, and many sets don't really seem to need it once components have been replaced are voltages are back at their proper operating values.

I don't know about these other 2 replies, but I have been using the Aircraft version (150) for about 3 years now and wouldn't want to be without it. I am on the second one as the first one had a bad solder joint at the output. The reason I know is I chipped all the epoxy out to see what was in there. There is a balun and 3 Dale Product resistors. Not just a large 50 ohm load as most think. I have the schematic of it if anyone is interested. I have mine mounted on my tower and have and a wire to each corner of my lot (270ft total) with the other end roped to my tower, not connected to the tower. I can set my xceiver to any frequency from 1.6 - 30 mhz and have a 1:1 swr. Whoever says they are a 50 ohm resistor in a box is full of it. I get as good reports from stations as others running more than my 100 watts. This model is rated at 150 watts. Yes they are expensive but as far a I am concerned well worth the money. This is strictly my opinion. No, there were no other nut and bolts in there for weight. Just solid white potting.

I think the point John was trying to make is that most of the problems in the radio would not have been problems if he had just wholesale re-capped it to start with....and not that a "n******" would actually consider working on that particular type of radio as a first project......more a documentation of some problems that can come up in working on these radios...and a good sound example of doing wholesale re-cap jobs on the radios we work on.

They would probably offer two solutions that I can think of. One,
they'd ask how the heck the PC was damaged enough to need replacing,
then deny the claim. Two, they'd give you the PC.......bare.

I did not see the original post, but bear in mind that this approach has been used in the past as a way to deliver virus code to the unwary.

Software developers (I'm one) usually have ample beta testers without "urgent" pleas to the general population, so if that's what this was - beware!

It's dummy load that you hook dipole elements to. It will radiate. So
will a wet noodle.

Dick

The AR-2 .... sigh...

First nonhomebrew receiver I ever owned. About 1968 I got the AR-2 in the cabinet and a QF-1 Q multiplier for just $20. It was older than I was back then! Used it by itself, then as an IF for a Gonset Super Six converter. At one point also had a DX-20 and VF-1.

It was really not much more than an "All American 5" with a transformer power supply, BFO, bandspread and shortwave coils. Wonder what they cost Heath to make.

All of that old gearl gave way to homebrew gear that was better!

The AR-2 had a separate BFO, but no antenna trimmer or accessory socket. The AR-3 had a "reflex" BFO, but added the antenna trimmer and accessory socket for a QF-1.

There was also the ancient AR-1, but that's another story.

For sale:

Selling for an inactive ham whom I work with (Larry, W5DXW):

Swan 400 transceiver, 420 vfo, and 117B power supply. This is a
PROJECT RADIO, not a museum piece, and it needs work! If you're
not able to work on old tube-type radios, this one ain't for you.

Operationally:
I powered it up and it receives surprisingly well on all bands,
and does not emit smoke or flames (don't laugh... I had an old
rig from an estate sale catch on fire on me once!). I did not
test the transmitter because I don't have a suitable antenna or
a dummy load available at the workbench in my garage. All I had
handy was a 6-meter mobile mag-mount antenna, hanging upside-down
from the garage door track, and I was amazed at how well signals
came in. The controls and switches need to be cleaned, for sure.
The vfo is stable and appears to be in good calibration. The
crystal marker is also working, but I'm not sure how well it's
calibrated (easy enough to adjust, however).

Cosmetically:
The set is in "good" cosmetic condition, but it will need a bit
of cleaning and sprucing up. All of the markings on the front
panel are present, but most are worn (still readable, though).
The gray paint is good. The cabinet has some scratches and
chps in the paint, but it isn't ugly and it isn't dented. The
vfo and p/s look good (especially the p/s - it shines!). There
is a chip in the edge of the meter face, but the face isn't
cracked and the meter works. The rig came from a non-smoking
household, so there's no nicotine residue (thankfully!).

Miscellaneous info:
I do not have a printed manual, but I do have three 5.25" disks
with scanned manual pages that I downloaded from K4XL's BAMA. I
believe that the rig has been in Larry's family since it was
new. I know his Larry's father owned it before he did. I don't
have any pictures of it, nor a means to take and post them easily.

How much is it?
The price is $150.00, and the buyer will pay shipping charges
(or, can come by my house and pick it up, a few miles north of
Dallas, TX).

The biggest scam ever? The thing is nothing more than a balun and a load resistor (which gives you that 1:1 match) with antenna terminals on either side. Some of the units had pieces of circuit board with transistors and other parts on the boards inserted into the potting material along with the load resistor to try and fool the people that put the thing through an Xray machine. It was meant to look like a complex circuit.

You can build your own for only a few dollars. Yes a dummy load will radiate if you connect an antenna to it. How much of the power is left over for the antenna is another question.

The ARRL did some tests on it several years ago and as best I can remember the amount of power left for the antenna was in the order of from 10 to 25 db down from the input depending on the length of the wire and the frequency. Not surprising that with that kind of loss you get a near 1:1 match at the transmitter. The transmitter sees mostly the dummy load and very little of the antenna load. No magic tuner or matching unit here. Just plain laws of physics.

Is it all bad? If you have a need for your transmitter to see a good match on any frequency without any tuning and you are not concerned with how much of the power gets radiated, then the thing works for you. The only bad part left is the price. You could build your own for about $20.00 !

> fault, or, at least, a single 'root cause'.
> <snip>
> Replacing ALL the paper caps removes them as potential troubles, and
> testing the tubes decreases the likelyhood of them being a problem

Well said, Neil.

There's a big difference between restoration (what we're doing nowadays) and the standard "repair" approach that was appropriate when these radios were still fairly new.

In a "repair" approach, described in classic books like Marcus & Levy, the repairman is indeed looking for a single problem or problem cluster. For instance, a leaky cap caused a resistor to burn, or a bad filter cap caused the radio to hum. . The serviceman quickly finds and fixes the gross fault, and the radio works again.

That approach won't work as well on a fifty-year old radio as it did on a five-year old radio. Old radios always suffer from a bunch of small, age-related problems, and those problems are basically the same in every case. The "repair" approach may cure a gross fault that caused someone to shelve the radio years ago. But it won't cure the minor ills which can also seriously degrade performance.

What we are doing now is RESTORATION, not "repair" in the traditional sense.

In a typical forty- to fifty-year old radio:

1. Everything is covered with dirt and/or grime.
2. The power cord is missing or unsafe.
3. All mechanical parts (tuning capacitor, etc.) need cleaning and relubrication.
4. All controls (volume, bandswitch, tone, etc.) need cleaning.
5. All of the paper capacitors are bad, or will soon go bad.
6. All electrolytic capacitors are suspect.
7. At least a few resistors have drifted upward in value.
8. In addition to all the above minor ills, the radio may have a gross problem that caused a previous owner to shelve it.

When I work on a radio, I basically go down the list and cure things in the order given. The radio is cleaned. The power cord is usually replaced (and a fuse installed). Mechanical parts are cleaned and relubricated. And so on.

Understandably, many folks just want to fix "the problem" and get the radio working as quickly and cheaply as possible. They are misapplying the "repair" approach. There may indeed be a single gross problem lurking in there. But in the case of a fifty-year old radio, the real "problem" is that IT'S FIFTY YEARS OLD !! :-)

My favorite analogy is to finding a fifty-year old car in a barn. Let's say the last owner parked it because it blew a head gasket. A good repairman could diagnose and fix that gross fault with ease. But nobody in his right mind would then jump into that unrestored fifty-year old car for a trip across North America. Sure, in some cases you could pour fresh gas in the tank, hook up a battery, start the crate and move a few feet across the barnyard. But you'll be broken down by the roadside before long. And driving an unrestored car at highway speed may cause much more serious damage than was present when you found it. For instance, if the engine oil has leaked out or turned into tar, the engine may seize. You didn't save any time or money by fixing only the most obvious problem (blown head gasket) and ignoring all the car's many age-related ills.

Restoration means curing the universal age-related problems (steps 1-7 in my list) as well as any gross problem specific to this radio (step 8).

I don't like to call this approach "shotgunning," and I don't agree that it eliminates the need or opportunity to learn how to diagnose problems.

In my experience, you will still have plenty of chances to diagnose and fix problems by the time you get to step 8. You may actually learn diagnosis more quickly on radios whose problem set is reduced, as Neil points out.

You can also learn by simple observation in the course of replacing caps and re-testing the radio. "Okay, I just replaced the audio caps. Gee willikers, the radio suddenly sounds better, although we still have problems X, Y, and Z. Okay, I replaced another cap. Gee willikers, problem X went away and problem Z is better. Oh -- I see now. X and Z are actually related."

To those folks who are reluctant to replace all paper caps, I'd suggest it's only a matter of timing. You can replace 'em all now while the radio's on the bench, or you can replace 'em one at a time as they continue to fail and degrade. As a beginner, I "fixed" a number of radios that didn't play very long. The radios that I restore now tend to perform reliably much longer.

Happy restoring!

What's a reflex BFO? My Hallicrafters S-120 had a BFO control that just grounded the suppressor grid of a tube (mixer or LO?) thru a pot. I guess it made it go into regeneration or something. All the signals sounded like they were gargling.

The S-120 was a transformerless abomination, newer than the AR-2 but probably not as good. I'm building a real BFO for mine and then I'm gonna attempt to have a QSO using it.

Actually, I know someone who did this with an RS tube. RS replaced it. (with
new
Sovteks, if I'm not mistaken.)

341. Surplus Auction of TV-7's

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-01-10 22:02:33 UTC
From: David Ragsdale <dragsdal@calpoly.edu>
Message-ID: <3A5CDBF9.51312F4@calpoly.edu>
Source record: 57551

I don't have any association with this, and if I were in Illinois I would try to get them, but Levy Latham, who is the Dept. of Defense contractor that disposes of surplus items has a pallet with three TV-7 tube testers on it, two appear to be in working condition. They are at the military base in Granite City, IL and you can bid on them here:

http://www.levylatham.com/auction/lotinfo.cfm?eventid=0314&lotid=0165&PleaseWait=OK

They don't ship stuff, you have to pick it up or have craters and freighters pick it up and ship it to you. I checked on packing and shipping to Calif via this route and it was only $600.00 for the pallet!

Nick Kennedy <nkennedy@my-deja.com> wrote:
> What's a reflex BFO?

I think the AR-3 uses the triode section of the 12AV6 (or is it a 12AT6?) as both an audio amp and BFO. I saw the schematic once but can't exactly recall. In any event there's no separate BFO like in the AR-2. It's the height of cheap.

> My Hallicrafters S-120 had a BFO control that just
> grounded the suppressor grid of a tube (mixer or LO?) thru a pot. I
> guess it made it go into regeneration or something. All the signals
> sounded like they were gargling.

I think that's the IF stage. The SX-140 did the same thing, as did early models of the HQ-100. You know the results better than I.
>
> The S-120 was a transformerless abomination, newer than the AR-2 but
> probably not as good.

Agreed! Lots of really cheapo-cheapo stuff was made, for a variety of reasons. See below.

> I'm building a real BFO for mine and then I'm
> gonna attempt to have a QSO using it.

Good luck!

There are other options, though.

WW2 surplus receivers can do a really good job - much better than most inexpensive BA receivers.

The 3-6 Mc. ARC-5 receiver is infinitely better than any inexpensive BA rx - dial, stability, sensitivity and ruggedness are much much better. Of course it only covers 80, but you fix that with a simple homebrew 2 tube xtal controlled converter. Add regeneration to the second IF stage and the selectivity improves somewhat. Swipe the tuning cap from a 6-9 Mc. rx, add three fixed mica padders of about 100 mmf and realign, and the bandspread and tuning rate improve mightily.

For a REALLY good BA rx, get the 190-550 kc. ARC-5 and put an xtal controlled converter in front of it. Pull up the IF can plungers and align carefully, and the selectivity is almost too sharp for SSB. This setup is only really good for 160, 80 and 40, but it is SOOOO good! (and you can add another converter...) I have one of these setups, with both 110 AC and 12 VDC supplies. (Dynamotor, of course.)

The BC-342 and -348 are decent performers if you do a few simple (and invisible)mods. But they are more money.

Of course the above all require searching for some parts and doing a bit of building/fixing, but they are not that tough. One great thing about the ARC-5 family is that lots of parts are interchangeable. Please don't tear up a mint one - look for the ones that have been chewed up and modded. Even if they are just parts sets, they can be a good deal.

The only part left of all that old BA gear from my novice days is my J-37 straight key, which I used on SKN.

Source record: 57553

Hi All,
I have a National NC200 for sale. This is the older one, produced between 1940-1943. It is all original, no mods made. This is one of Nationals coil-catacomb sets with the unique coil moving system. It had 10 bands, 6 general coverage and 4 ham bands. The ham bands are 10, 20, 40 and 80 meters. It has 12 tubes and needs an externaI speaker.
I don't know if it works or not, I am selling it for a friend and the power cord needs to be replaced.
I am asking $200.00 for it and that price is firm. It will be shipped in a foam-in-place box for best protection. The buyer will pay shipping and insurance costs. I have pictures for interested buyers to see. I would keep it and put it to work, but I already have a couple of NC2-40-D's and am running out of room here.
If interested, please email me directly at: nc183d@aol.com
rgds,
Mark S.

I hope you are being factious because I see you have an advanced class and I would not expect you to be that stupid. Or maybe you bought your license like so many other CBer's. Do you not even understand the equivalency of parallel or series resistors? The total resistance across the balun is 50 ohms if it is a 1:1 or X x50 if it is a X to 1 balun and you are sinking up to 50% or more of your power in the resistance.Of course your transceiver is happy but you you would gain 3dB or more if you took out the resistor and loaded your tranceiver in the correct way.

Hello!

Let me add my opinion about this comment:

>Life is too short to learn and relearn details about old radio
>circuits. I prefer to minimize the time spent fixing a radio and
>use the time saved to learn other, more practical things

I can not agree with this. Last days I have been working on one nice receiver, an Eddystone 830. It had some wiring mods, which I put back to original with the aid of the schematics. Once there, I studied it to see why the former owner had done those mods and, same time, understand the receiver circuit. Once this was fixed, the receiver still had a crackling noise, independent of AF gain. Looking again to the schematics and with the aid of an oscilloscope, I traced it to a point where only two caps and one resistor were found. It turned out to be the resistor, which was intermittent. Once replaced, the set is ready for a full alignment. And if I found any other fault, I will try to locate the faulty component or components. I find a great pleasure in knowing exactly what happens. If you change all the caps same time, you will loose a great way of improving your technical skills. Remember, for most of us (at least for me) this is just a hobby; we don't need to 'produce' repaired radios at a given rate...

Of course, this is just my opinion.

Best regards,

JOSE

Well, that's me... hi. I've re-capped virtually all of my vintage receivers EXCEPT my 1941 SX-28. It really does work very well. I do, however, harbor no illusions that a cap change-out is indicated. Virtually every paper/wax cap I've ever pulled out of all my older receivers were bad, in one way or another (leaky at best). I've read the horror stories of trying to get to the caps in the RF box and just haven't gotten the guts to go at it. At least I did the 'lytics, though and installed a fuse!. One aside; I did have to replace a shorted wire inside that box. I had to clip the bad one and run a bypass wire outside the box, itself. No space to maneuver around. Nuff said!

I think this is a great thread

Having resurrected several pieces of Drake gear in the past year, I believe it is an efficient use of time to replace all paper and electolytic caps, as well as any resistors which look as though the heat has been turned up too high (hi).

Having said that, I also agree with Jose that finding specific problems has a great satisfaction, although I must admit that I dont have his technical skills---[those of you who havent seen his website should go there immediately because it is one of the very best I have ever seen]. One of my "victories" was finding the cause of an intermittent BFO function in my R4B, which I accomplished simply by using the radio shack component freezer to spray the ceramic caps on the bfo board until I figured out which one was the problem--replaced it and it worked just fine--(ahhhhhhh)

I also must agree with the earlier comment that the problem with boat anchors is that they are so old---when I was a youngster I got a Drake tr4 precisely because I was tired of fiddling around inside my dx 60 and sx99 trying to improve performance and repair this that or the other. To me, when they were new, you didnt open up those radios much---you just didnt need to. That has changed with time and if you cant open, diagnose repair or restore them, you can't use them.

At the risk of displaying my boatanchor ignorance . . . does the HQ-150 even have paper caps? It's been long time since I peeked inside my HQ-160 or HQ-180, but I'm pretty sure the 180, at least, has none. If the small caps in your HQ-150 are the disc ceramic type rather than tubular paper (including paper caps cased in plastic), they're much less likely to be bad.

Cheers.

Got a few JAN-577W high-vacuum rectifier tubes marked as radioactive.
Wonder what kind of radiation the tubes are emitting.
My beta and gamma ray detector doesn't show any activity, maybe
alpha particles or neutrons? Does anyone know?

I've got another gas-filled cold-cathode relais tube, which made my
geiger counter
sound like a machine gun ;-)

Very heavy (approx. 1 cwt)
Good general coverage set for CW and AM broadcast
Can do SSB with care
As a SWL rx still very nice.
Many examples around in varying states of repair, bad ones can be
expensive to put right but most parts are still obtainable.
Need a wobulator to set up the IF but after a good re-align is very
nice.

Specs:
D - 540 kHz - 32 MHz in 6 bands,
Sensitivity for 0.5W audio is below 1uV across most of band
100W power required
2 RF stages 3 IF stages (IF = 455kHz)
Inputs for diversity

LF - 73 to 550 kHz in 2 bands and 1.48 MHz to 30.5 MHz in 4 bands
Better than 15uV for 20db SNR for MCW (A2) and 5uV for CW (A1)
Max power 2.5 Watts to loudspeaker
2 RF Stages 3 IF Stages (IF = 735 kHz)
Inputs for diversity

The D specs are taken from a practical wireless article, the LF ones are
taken from an LF manual.

They are very similar, the basic circuit is the same with the same
facilities and general performances. The main differences being the
bands and the IF frequency. The LF also has a neon spark arrestor in
the antenna inputs.

I have used an AR88 D for several years and like it very much. I prefer
an RA 17 for listening to amateur bands but the 88 is much better for
general SWL.

Hope this helps

This is an exceptionally clean R-390A in original condition. It has never been modified and is in excellent condition mechanically and electrically. The gear train looks completely clean and the VFO endpoints are linear within 300 cycles. I retubed it and performed a complete alignment a little over a year ago. It has not seen much use since then, but I just checked it out and it is working flawlessly. This Radio was built by Amelco under contract 35064-PC-62. The serial number is 2204. It is very clean on the inside, and is complete with top and bottom cover.

I'm not sure what the differences are between the original and the B model.

Aparently the other auctions have already ended.

All those manuals weren't there a couple days back.

Good luck.

Brian - your R-388 *may* have Sprague Vitamin "Q" caps (metal cased oil caps) that almost NEVER go bad. I had a 51J-4 that had disc caps in it too. Either way, I'd leave 'em in. But if it has waxies (or those miserable plastic encased red or black bypass caps) get 'em out of there.

The only thing I've seen worse than wax caps are the afore-mentioned plastic encapsulated caps form the 50's. Hallicrafters especially loved these rotten excuses for capacitors, using a particular brand that had colored stripes (like a resistor color code) that like to split down the middle leaving a pool of oil on the bottom of the radio.

>AR-2. It's the height of cheap.

I checked the AR-3 schematic. Sure enough, the 12AV6 triode section acts as both an audio amp and BFO! Never saw such a thing before or since.

One thing about the early Heathkits is that many of them used surplus parts. The AR-2 and AR-3 use a 12A6 - lots of them in surplus. Same for the 1625 modulators in the DX-100. Lots of other examples.

Iron core transformers and chokes were no problem because Heath's volume permitted them to get very low prices and custom designs from the transformer manufacturers.

Two unbuilt Heathkits recently showed up on eBay:

HG-10B - original late-'60s price $54.95, eBay price $655
GR-64 - original mid-'60s price $39.95, eBay price $1525

Those are not typos!

Cross-posted to: sci.electronics.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.boatanchors

We did our annual inventory and decided that we have too many of our DDS3 boards and parts. These older DDS solutions are now rather mundane compared to the 100MHz newer parts.

We are going to sell off the boards, a kit of passive parts (plus voltage reference and high speed DAC) and the 33.554432MHz crystal. It looks like $35 ppd. in the USA would be the right price.

You will have to furnish a Qualcomm DDS chip (Q2240I-1N) and a smattering of other parts.

The data sheet is at: http://www.novatech-instr.com/dds3.html

Anyone interested?

Thanks,

Steve.

Folks --

Last week, I ordered a 40/40/40 525V cap from Antique Electronics Supply. Since it hadn't arrived within a week, I gave them a call. Turns out they are out of them, as well as a good number of their other FP caps.

Their supplier sold them the tooling to make the capacitors, and AES said they were waiting for OSHA approval before starting to manufacture the caps. The bottom line is that any new caps ordered probably won't be ready until mid February.

FYI

Ugh! You've raised more bad memories--I had an SX-140 too. Thought the 'SX' would make it a good receiver. Wrong! It had some kind of control that worked kinda like a Q-multiplier. But when you tweaked on it, the received frequency would change by a great amount.

I had a selection of bad hallicrafters receivers--S-119, S-120, S-20R, SX-140 and SX-111. If only I'd had a Drake 2B in time, I wouldn't be the bitter 50-something ham I am today.

That's more than I've got. I busted the paddle off of my Jap bug way back then and sold everything else. And me and my brother burned down the wash-house and all my early QSLs with it.

Had to got re-purchase some of that old junk to prove to myself that it really was that bad. But I love my HT-40, DX-35, VF-1, Johnson Matchbox and finally ... Drake 2B.

Probably just betas or gammas below the threshhold of your detector.
Alphas would typically be stopped by the glass tube and neutron
emitters are pretty rare.

I bought a junker Civil Defense radiation monitor at a hamfest recently
but haven't tried to make it go yet.

It's getting harder to find radioactive stuff for testing. Used to be
that Coleman lantern mantles were good and hot, but no more.

"Didn't work too well", but it did work, so doing a recap is more than
likely to improve things, certainly not going to make it any worse.
Start with a dead radio, a recap may or may not bring it back to life.

Just to add another point of view, IMHO I feel that blanket re-capping
of a collectable vintage radio should not be done - just fix those
that are bad, otherwise its original condition and value is seriously
compromised.

Is anyone really looking for tiptop performance from these sets?
Surely you would use something more modern if you need a set for
serious use?

Possibly correct, but lots of us here don't collect and\or recondition old radios for their value as collectibles. I just flat out love old radios, trains, buildings, toys, etc, etc, etc,..... The radios I have in my collections have no value to me beyond the pleasure they give just being what they are. As for what they're worth on ebay, I don't care. I've been somewhat a defender of those who don't do an immediate recap on certain items if the intent of the restorer is to learn about proper radio troubleshooting. But if a radio is to be used as originally intended, a recap is certainly prudent.

> Is anyone really looking for tiptop performance from these sets?

Well, I've never seen a modern AM radio that's any better performance wise compared to a properly restored quality vintage radio. The best radio in my store to reach WFAN NY from CT is a GE console that plays daily, it amazes everyone who hears it. As far as tonal quality, a large tube console completely outclasses the sound my AM tuner\Hi-Fi\3 way speaker system that I have in my audio room.

Hello all Drake enthusiasts!

This year's Drake Forum will take place at the Dayton Hamvention, Ohio, Saturday May 19, Hara Arena, Room2, 9:45-10:45.

I'm the one who's taking care of it and is the moderator at the Drake Forum this year, but with great help from Don, W8NS and others.

The program is not complete yet, but Robert Sherwood of Sherwood Engineering Inc., and Riley Hollingsworth of the FCC will be there.
And I may have a slide presentation of Drake Protypes and Drake test fixtures etc. - units most people never have seen; if there are any interest? So what' ya say?

There will be a raffle of a Drake TR-44B Communication Station, and the drawing will be at the Drake Forum. Maybe you'll be the lucky winner of a near perfect TR-44B ! Well, you have the opportunity now. For more details and pictures, take a look at http://home.online.no/~sindtorp/raffleTR44B.htm

I hope to meet many of you at the Drake Forum, Dayton Hamvention 2001 !

Sindre, LA6OP

In the TW-1000/2000 series, Hallicrafters used dull red plastic cased
caps that are 100% bad. Getting all of them out of the turret tuner
assembly requires serious disassembly of the radio to get the tuner
out, and, usually, there is a mechanical 'fix' to the band switch drive
gear that makes removal of the gear (and tuner) extremely difficult :-(
The caps MUST be changed, but access can be impossible without breaking
something.

Well, IMHO, unless the set is a classic ancient set with unusual
capacitors, there is no real effect on the value if it is recapped such
that the recapping is virtually invisible.
Not wanting to restart the long thread on the subject, if a set has any
REAL value, one simply restuffs the OEM cap cases with new film caps
and electrolytics. If this is done well, one needs to look closely to
see any difference, and it would be a pretty anal purist that expect
perfect originality over functionality, again IMHO.

Neil,

I rebuilt a TW2000 and had to replace these caps. I managed to get to them by just removing about 4 of the clip in coil assemblies and rotating the drum until I could see them. It was tricky, but not as tricky as taking out that drum. BTW, one of the caps was shorted, which was why the radio didn't play. I figured I may as well replace them all.

>compromised.

AGREE if it is a $20,000 Marconi one of a kind.....but if its just another Philco of Zenith......I disagree the value will be higher after a competent restoration of the electronics....

>Is anyone really looking for tiptop performance from these sets?
>Surely you would use something more modern if you need a set for
>serious use?

is a word YES.....I want that old radio to work as well today as it ever did....better even than it originally did if that possible......

As for doing a Re-Cap first and then doing the trouble shooting.....yes sometimes you shoot yourself i the foot.....but even perhaps with Jim's radio....had he known of all big problem with the switch and osc part... he might not have elected to even try to fix it......thinking about the added work of fixing it.....

Hate to think of how many Osc coils I have re-wound.......nope the pay is lousy.......but the satisfaction goes up imensely.....
---
still think and agree with John WB0POZ that for a lot of Newbies the right beginners approach is to re-cap it first and then look for anything else that left....and thats what he was trying to point out in his case History
---
If the Newbie is experienced enough to take a shot at troubleshooting first is also OK......some stuff does make sense....like decidiing if the power transformer is good or bad.....maybe ohm out the coils.......but even then the transformer is not that big a deal.....yes a pain sometimes to find one that fill fit the holes and the electrical requirements.....
....anyway....its my opinion....

Of course I want tiptop performance...and reliability. Find me a dependable, attractive modern 2 or 3-band table radio with shortwave and a nice tone that doesn't overload from a local AM station and I might re-consider.

Hello Mike!
As you find yourself looking at all the possible conversion articles and the associated power supplies, there well may be an error in many of the articles regarding the power connections. For example, an "Electric Radio" article and the Surplus Conversion Manual Vol. 2, have a nice conversion discussion but each contain an error for the connection of the meter shunt resistor (ref; Pin 9, of the power connector). These articles show the resistor going to pin 9. In reality the 12.5 ohm (nom) meter shunt resistor goes to ground in the power supply, as does the incoming Pin 9. The original dynamotor supply made this ground connection via a relay. Another thing to watch out for is that while tuning up, it is absolutely necessary that a couple of the autotune stages MUST be set to the proper rotation point for each "band" segment. If this is not done, the HV will not be connected and there will be no drive nor output. Sometimes you have to rock the autotune left and right of actual indicator point the proper contact. I'm finishing up my power supply now. Good luck with your unit! 73 de Jeep/K3HVG

Radiotron Designers Handbook, 4th Edition, Second Impression (Revised) by Langford-Smith, 1953. A
MUST-HAVE book for the serious tube audio/radio devotee.Overall appearance GOOD. The red cover is slightly faded and bowed, gold lettering on spine somewhat worn. Pages EXCELLENT. Has stamped name of Army organization inside front and back covers, impression where library card was removed. Weight 1.67 Kg/3.7 Lb.

JPEG's available - just ask.

Best offer plus shipping from Australia.

John Mackesy

This Hammarlund HQ180 is in excellent mechanical, cosmetic, functional condition. Cosmetically, I would rate it a 9 out of 10. All the tubes have been checked out and the radio was recently aligned. It is working flawlessly. The HQ180 is one of the finest shortwave receivers from the vacuum tube era. It's performance on shortwave is still comparable to some of the finest receivers today, and it's performance on the AM broadcast band is superior to all but the best commercial/military receivers. The HQ180 is somewhat unique due to it's triple conversion design, which gives it excellent selectivity without the ringing associated with tight mechanical filters. It is also known for its excellent slot filter for rejecting unwanted interference in the passband. I am including a copy of the operators & maintenance manual with this fine radio.

Source record: 57524

I have both and my preference is generally for AR88Ds as they have received less use (abuse) over the years. The LF version is ok down to 73kc, but if you are interested in LF there are better receivers for those bands....vintage ones too if that is your interest.

The receivers by now need all the capacitors changing. The RF and IF stages come alive with a set of new caps. There are also key resistors which you shoule look for as they go high over time. the basic receivers are nice to operate and have an air of nostalgia...probably due to the yellow tuning dials and a unique AR88 smell.

Performance is good, but less stable and less sensitive the higher in frequency you go.

Valves are getting rarer these days, but in my 25 years of AR88 ownership, I only recall replacing two really dud valves....one last week, a G2 to G1 short in the final audio 6K6 on my AR88D

Send reply with your address if you want a copy of the manual and circuit.....I can easily find my AR88D manual, but the AR88LF manual is lost in the shack...might take a week or two to find that one.

Message-ID: <93r3gbegq3@plutonium.btinternet.com>
Source record: 57543

NOW AVAILABLE:

NEW Program "Pi_L_NET.exe"

Pi & Pi-L OUTPUT NETWORKS FOR RF POWER AMPLIFIERS.

The program is in two parts. For given RF power output, RF plate/anode/collector volts and external load resistance, the first part computes either the L and C component values of a Pi-L network or of a simple Pi network.

The second part allows the L and C values to be varied in fine increments while observing how the input impedance of the network varies. The network input impedance is the load presented to the amplifying device: triode, tetrode, bipolar transistor, FET, etc.

In particular the input impedance can be observed as the tune and load capacitors are varied as in an actual amplifier. Or as frequency is varied off-resonance up to harmonics of the carrier frequency.

The program can also be used to compute L and C component values of Pi or Pi-L impedance matching networks between any two resistances. The phase delay through the network can be specified if needed for particular applications.

File size = 50 Kbytes. Download from website below in a few seconds. Not zipped up. Run immediately. Absolute bargain.

According to Sibley's "Tube Lore", a "negative resistance" oscillator tube, used as a xtal oscillator in 1935-37 Collins xmtrs. Apparently equipment was converted to use a 2A5 once the C-100D was discontinued.

I have 3-RCA and 2-Sylvania, 6JS6's, used/tested like new.
I tried them out and all are full output.
Asking $15.00/each plus postage or $70.00 for all five and I will pay the
postage.

Hi,
It was an attempt to get around some RCA patents. It's a very long story, going back to original work by Robert Goddard (yes, the rocket man) in the teens. Keep a careful eye on those tubes.

Wanted----

Help please! I am looking for the VFO and receiver tuning 'dials' (all lettering/freq. markings intact) for the Lafayette HA-460 six meter AM transceiver. These are aluminum disk-like and about 1.75" in diameter.

Also need the hand microphone (gray in color, 'L' logo in center of mic) for the Lafayette HA-460 six meter AM transceiver. Perhaps some of the Lafayette CB's of that era used the same mic.

Will also purchase an HA-460 parts rig.

Thanks
Emil

While I missed the original post, from this I get the idea.

Motorcraft plugs or NGK worked best for me.
High quality plug wires.. there used to be a "spiral wrapped" metal cored wire but the name escapes me right now, but they worked very well.
High quality cap/rotor.. i.e. Bosh or the like.
high quality copper braid from block of engine to frame, clean the end points before attaching and a dab of conducting grease will work wonders to keep it a good connection through the rain/snow seasons
I have seen but not tried the dragging of carbon brushes to act as a connection to earth ground. Might work/help
Shield the coil (once I used a beer can with the ends off and a split in the middle)
Noise suppresion on the radio... using some of the kits nowdays the boomerboys like to use.. big caps. Again, there used to be a kit to fit between the alternator and the wiring harness to filter out some the noise it will generate. Like I said, check out the car stero stores where they put in the mega systems.

I agree with John on one point.. my Zenith console does sound better then anything "new" I own. In fact, both my wife and I were amazed to how good "AM" can sound. I grew up listening to crappy AM and thinking along it was that way just because. This Zenith has been quite the eye opener.

Value? I'm sure it has value.. but I will defend my recapping off EVERY one (which all were bad.. leakage mostly) and 90 % of the wiring (rubber which had fallen off) So what if it's not "original".. I can play it safely and it's gives more pleasure that way then being static and purely decorative.

Just the way I look at my own radios.. each to his/her own

445. FA- Hallicrafters SX-42 NOS Power Transformer 52C141

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-01-14 16:45:36 UTC
From: "Donzil Q. Worthington" <djworthington@cybertrails.com>
Message-ID: <qNk86.2428$i25.848835@mick.cybertrails.com>
Source record: 57455

I put a NOS Hallicrafters Power transformer up for auction on Ebay, I have been informed by several Hams that it is the Original OEM NOS power transformer for the SX-42. Since I did not know that when I listed it, I did not label it as such. I thought I would post it here in case anyone has been looking for this part. Since it is not labeled as such on Ebay, you would not find it by searching titles. It currently is at $15.00 and closes early this afternoon (Sunday).

The item is located at:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1206484534

I have never posted something on boatanchors from my ebay items before, but due to the circumstances I thought I would in this instance.

Thanks for the opportunity, Donzil WS0F Prescott Valley, Arizona

Hi, I'd like to have a spare pair of true Eimac 3-500z tubes, they don't need to be electrically matched. They don't even have to be new as long as the output is full and normal. What have you got?

Yes, I know I can get them and other brands from the RF Parts, etc, but they are a bit out of my budget.

Thanks!

Neil, K1VY
(603) 465-2788
(800) 962-2949

P.S. Also, while I have your attention, I'm still looking for a noise blanker for my Drake TR-5 and TR-7 (NB-5 and NB-7/7a respectively). All leads gratefully accepted.

The bandspread dial is calibrated for the amateur bands, at the time that model was manufactured. The 20BS is a separate band to provide adequate spread for the 20 meter (amateur) band. The HQ-170-series receivers also included this feature.

From: novatech@eskimo.com
Message-ID: <93t0hv$i8c$1@eskinews.eskimo.com>
Source record: 57461

I have a radio with a BC-342-N nameplate. However, it also has a Dial light dimmer control. To me this means that it is really a BC-312 that was converted by someone and the nameplate changed. This radio saw late service as it was MFP'ed in 1951.

Anyone know if there were any "legal" BC-342 with dimmer controls? My data all shows crystal phasing on the 342's and dimmers on late 312's.

The radio is in nearly perfect repair other than this anomally.

Thanks,

Steve

Although the HQ180 is a good receiver, and it is one of the better ones that were made, you are passing some misinformation about the I.F. subsystem that this receiver uses, as compared with other designs. It does have good selectivity, because of its 60KHz final intermediate frequency, but it is no better that the triple conversion Drake receivers, which used a 50KHz final I.F., or some of the Hallicrafters receivers, which also used a 50KHz final I.F.
Also, the comparison that you make with mechanical filters is off base. Mechanical filters, when properly terminated, do not ring, and exhibit very low anamolies in the passband. I have been designing receivers for a few years now, using Collins Mechanical Filters, and have had very good results. Anyway, on a final not, the HQ180 is a VERY FINE receiver, but come on, let's keep things in perspective!

Original 2 meter Gonset Communicator I transceiver in good condition.
The tubes all check good & I had it on the air this week. It transmits
good quality AM and receives AM signals and also FM repeaters. Ask me
for a picture! $85 plus shipping from Schenectady, NY

Hi there.

HOW ABOUT a LINK to the NEW CRYSTALS swapping BBS?

There is a NEW Crystal Exchange Message Board (free) on the
web at:

http://senac.com/boards/880/

There you can post sale & want ads and find radio crystals for sale
by others!

Sell your excess crystals there!!

The previous old message board was being ruined by Taiwanese
infiltrators that ruined it with off-topic SPAM ads. This one is
secure.

The above is all hobbyist and non-commercial. OK, the BBS has
sponsor ads, that is how we get it free.

I have concentrated all of my HAM LINKS
efforts over the past few years to editing the Open Directory
system, and I am the editor for all of the Ham Radio
BOATANCHORS links on there.

I like the robot that automatically removes any bad links for me!

We have a broad variety of specialty links to over 700 sites
(arranged by category) of interest to hams who enjoy antique rigs.

Please also link to:

http://dmoz.org/Recreation/Amateur_Radio/Boatanchors/

My first job after college was working at WFMJ-TV, and that chief engineer (Seymour Raymond, recently deceased, an acquaintance of my dad's) hired me. He always was Scotch with the station's money. We still had the original RCA TK-11 B&W tube cameras (circa 1953) as "backups" and field/remote units in 1972. He told stories of the terrible difficulties they had keeping the station on the air when they first were licensed as channel 73 in 1953. Their original 1kw transmitter (RCA TTU-1A) used 12 triodes in parallel in the final and they would trip the breakers whenever the antenna SWR glitched (which was several times a day). Must've been fun.

Source record: 57419

I have a Tempo-One (silver face) with the AC-One power supply and manual. The power supply is not in it's original cabinet but all of it's components appear to be there.
The radio lights up and has minimal (2w) power output. I swapped another pair of final tubes (6JS6-C's) and still have the same low output. The receiver does work but audio output is low.
I'm looking to get $100.00 plus shipping or swap for something I could use (what-have-you) that's working.
Please reply to my email address (yardleyite@aol.com) only. I'll be happy to answer any questions.

511. FS: National NCX-500 w/supply and manual

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-01-16 17:05:29 UTC
From: yardleyite@aol.com
Message-ID: <20010116120529.09024.00001590@ng-cr1.aol.com>
Source record: 57420

National NCX-500 with power supply and manual. The radio lights up but it does not get any audio or power output. The case has a few scratches but is otherwise in good condition. The original finals were 6JB6's but someone installed a pair of 6LQ6's in it. I've tried another set of marginal used 6LQ6's from another radio but still did not get any power output.
I'm asking $150.00 plus shipping or trade for something of equal value. If interested please email me directly at yardleyite@aol.com.
Thank you for reading this and 73.
Joe Cro N3IBX

512. FS: Siltronix 1011-C and 1011-D 10 meter radios.

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-01-16 17:16:12 UTC
From: yardleyite@aol.com
Message-ID: <20010116121612.09024.00001591@ng-cr1.aol.com>
Source record: 57421

Both are clean cosmetically but not functioning electrically. The 1011-C has a few stickers on the VFO knob etc. The 1011-C lights up but no power output or receive. The 1011-D (very clean) has a shorted power transformer so don't even think of plugging it in. The Hamfest seller I bought it from assured me it was perfect - He could of at least told me about the transformer!
Anyway, the posibility exists that one good one could be made from the two I have. The 8950 finals in both of them appear to be good.
If interested, $75 plus shipping (or swap for something interesting) takes them both. Please reply to me email address (yardleyite@aol.com) only.
Thank you for reading this and 73.

The entire manual is there for you to download and print out, free.

A weak tube, improper tuneup or a load outside the rig's aceeptable
matching range are the first suspects.

I have just purchased an Analab scope and I am Looking for information about it. it sems like it was a pretty good one in it's day, must have been because it still seems to work properly. I want to use it for analzing old radio circuts.

if anyone has a manual or schematics for an old beast like this I would like to learn a bit more about what it can do.

I also have a Sencore SM 152 sweep and marker that I got from the same guy. I am hoping that I can use it as a signal generator ? to do radio allignments ...I would like to find out anything that I can about this as well.

1) Knight P2 SWR bridge with meter unit and remote sensing
unit/cable. Excellent condition. Picture available. Will sell for
$19.00 plus shipping.

2) Micromatch Model 262 SWR meters, with remote sensing
unit and cable.

Classic style equipment. This will look GREAT with any antique
ham radio station! I have two of these. One with the remote
sensing unit in solid metal as pictured on web site.

The other one has the same meter, but the remote sensing
unit has the more normal 'basket metal' finish. Same color.

They look great with Collins and other tube era rigs.

Both units are in excellent condition.
Will sell for only $25.00 for each unit, plus shipping.

530. Need help on B&W 5100B

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-01-17 15:35:16 UTC
From: David Fleming <davefleming@novagate.com>
Message-ID: <944e3k$82m$0@205.138.138.3>
Source record: 57440

Anyone out there that has had great experience with running the 5100B on AM phone might be able to tell me the normal operating conditions. I have this unit operational but I'm just not confident that I'm running it properly. Cw mode is no problem, but the manual description for resting modulation current of 55 mA, and then operational current of 225mA seems contradicting to me.
Cw mode calls for a maximum of 300 mA operational current, which is easily acheived.
The modulation unit had a bad capacitor and a dead driver tube, and now is giving me about 75 mA of plate current on peaks, above the 225mA. This seems like I am running those 6146's into the ground, but then again, I am just not sure.
Any assistance would be great, and perhaps a schedule to check things out over the air, too!
I'm in Western Michigan,
near Muskegon.
My call is NS8S
Dave.
Thanks for reading!

531. Re: Need help on B&W 5100B

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-01-17 16:04:55 UTC
From: mccrk@aol.com
Message-ID: <20010117110455.17627.00000548@ng-cf1.aol.com>
Source record: 57441

On the B&W 5100 B, the 225 ma. refers to the final amplfier plate current on AM. For CW and SSB you tune up the rig to 300 ma. on the final amplifier plates. For AM you load the final to 225 ma.

The modulator resting current can be adjusted by one of the potentiometers on the chassis, and probably should be adjusted if you change the modulator tubes. But check the meter reading (meter switch in mod. position) before you decide to adjust. See the instruction manual--and be careful, because there's 600 volts floating around in there.

When you speak into the microphone the meter (with the meter switch set on mod.) should peak no higher than 100 ma. With the meter set to plate (or PA, whatever it says), there should be virtually no difference on voice peaks.

Hi...My 5100B has bad meter shunts that give false readings. I hv not
figured out how to fix so just use my wattmeter to get 100w out on AM.
I get very good reports..... Set bias with VOM.....73 Bob, AA8A

I have a mil surplus modulator unit from APS-104 search radar (likely from B-52 bomber - 1960s vintage). Was used to fire a large pulse magnetron (in another unit). Contains a 4C35 thyratron, four 3B29 HV rectifiers and a few smaller tubes, oil caps, relays, transformers and other parts all in airtight aluminum canister. Also have copy of service manual (extra $5 for all, n/c for just the basic schematic & info). Still in original box, but used, collector's item, $55 (prefer pick up - box exceeds UPS size limit).(For an additional $20, I can shave down the foam insert and modify the box for UPS shipping, just takes a lot of time & effort to do this, and will cost at least another $40 to $60 to ship 105 lbs.) Great collector or experimental item. Located in southeast Alabama, 36330 zip. Email or call 334-347-5281 day/eve.

If you live in California - please consider upgrading to battery powered solid state radios.

Those old AA5 radios suckup waaay to much power.

I would be happy to take them off your hands... just ship them to Texas!

NO MO' KrazyKaliforniaKilowatts... The whole state's going QRP....

(AP) SAN FRANCISCO, California -- Much of Northern California is in the dark Wednesday afternoon because state regulators ordered rolling blackouts after lower electricity reserves threatened to crash the state power grid.

Neighborhoods on the Pacific Gas and Electric system are being darkened one by one, including parts of Santa Cruz, Capitola, San Jose, Cupertino, Oakland, Burlingame, San Francisco and Richmond.

The blackouts cut off all electricity to homes, schools, businesses, factories and even street lights and traffic signals.

PS - Word on the street is that BayGen is coming up with a power unit for family houses. You just crank it 5 minutes for 30 Minutes worth of AC.

I have a bunch of extra HRO coil sets for sale, these are the vintage type with handles, all are single range coil sets and all have been tested in my HRO-M.

J 50-100 kcs (2) $30 ea
H 100-200 kcs (1) $30
G 180-430 kcs (2) $30 ea
E 0.8 -2 mcs (1) $90
D 1.7 -4 mcs (3) $30 ea
C 3.5-7 mcs (1) $30
B 7-14 mcs (2) $30 ea
A 14-30 mcs (2) $30 ea

All plus shipping from Central Florida. Would trade to get an F coil or an HRO-5.

Thanks

George

Good morning:
I have two Heathkit manuals for sale and both are original manuals.
1. SB-634 Station Console Assembly manual $18.00 shipped
2. SB-220 Linear Amplifier assembly Manual $18.00 shipped
This manual has some burn marks on the back cover and
pages(probably put his soldering iron on it, Hi Hi). Also an
original flyer/spec sheet(Two hole punch on this sheet, but kind of
neat.)
Both for $30.00
Funds in a money order, Postal or regular.

562. FS: QST's 1920's to present

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-01-18 13:24:21 UTC
From: k9uwa@arrl.net
Message-ID: <946qq5$2bf@dispatch.concentric.net>
Source record: 57370

About a dozen of these are in the 20's.....about solid from 30 to present time with several years binders. There are also duplicate sets in the late 40's and much of the 50's.... If I parcel these out they will go well over $1000 on E-Bay.....then I have to box all of them....and take all of them box by box to the post office....I don't have the time and don't want a sore back from moving all of them that far...so for something around $400 you can have a nearly complete set of QST's......if you come get them....

E-Mail to k9uwa@arrl.net and we will talk......location is Ft Wayne, IN if you hit the Reply Button.....take out the NOSPAM part....
thanks
John k9uwa

568. FS.R107 Tube Receiver (WWII)

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-01-18 17:13:01 UTC
From: "radio-exports.com" <info@radio-exports.com>
Message-ID: <t6e8klsaoul042@corp.supernews.co.uk>
Source record: 57377

Here at radio-exports.com,based in the UK,we have just taken delivery of a really nice example of the vintage British Army receiver Type R107, from the second world war era.
This is very well built 9 tube set,covering 1.2Mc's to 17.5 Mc's.It will operate on both American supplies or European (100-250 volts ac) or 12 volts dc.
It is in very good original condition,with original finish and lettering on the front panel and all knobs and switches are present and correct.
It is somewhat unusual ,in that most of the R107 receivers which we have seen at radio-exports.com have lost the protective case front ,years ago.This especially nice example of the R107 still has the protective case front ,and,even more unusually,it still has the large scale receiver schematic,correctly fixed inside the lid.
The R107 receiver is impressive, for a number of good reasons.
Firstly, the "flight deck" array of front panel controls -no less than 14,plus various sockets,for antenna,headphones, etc.
Secondly,it is impressive by virtue of it's size and weight;
24" x 13" x 17.5" and almost 100lbs on the scales.
This receiver is also in good working order.
A copy of the very comprehensive manual for the set is included.
A classic boatanchor if ever there was one!
The price for this impressive piece of WWII kit,which includes the cost of packing and air freight to the USA,is $540 US Dollars.
If you require any additional information, or simply want to order,please contact Graham Leo info@radio-exports.com
Thank you for your interest and attention.

From: Gary - KJ6Q <davison7@gte.net>
Message-ID: <L_G96.467$lx.169568@dfiatx1-snr1.gtei.net>
Source record: 57381

I always removed the side cover on the right side (looking from the front), after removing the top cover of course, be SURE to mark the position of the VFO alignment slots on the rods extending thru the top cover, and be aware that the metal clips on the bottoms of those rods WILL fall out if not handled carefully! It's a good idea to inspect and move the 2 watt voltage regolator resistor down below the chassis too while you are at it... They fail often, burn up and damage the surrounding phenolic material, and usually place WAY too much voltage on the regulator tube. That cover IS a bitch to remove, the side cover securing nuts below the chassis are the worse, but careful bending of components down there, along with patience and ingenuity WILL get the job done!

573. Re: Turn OFF those BA's!

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-01-18 22:30:06 UTC
From: Bubba <ng_feedback@onebox.com>
Message-ID: <3a676e24_2@newsa.ev1.net>
Source record: 57382

A Texas "Bubba" writes:

Man, this really kills me. Blackouts occured UNANNOUNCED! Now you KNOW they have all that fancy equipment in the substations and power stations to monitor the Grid --- so WHY couldn't they make an annoucement on the radio a few hours before it occured? Everyone could have powered down and gotten off elevators and such.

Me thinks, the LA Law types are gonna go crazy in court.

Now as for that other stuff about not enuff generation... Baloney - the power utlities contributed millions to the political war chests and in turn, the legislature give them a blank check. The power utilities wrote the law, the legslature rubber stamped it.

The theory being that the California utilities were "lean and mean". They didn't count on someone being "leaner and much meaner". If you traced were all the money went, it went out of state. Energy company profits in Virginia are up 7000 per cent (not a typo) and an energy company here in San Antonio pulled the plug on finances not because they were owned so much money but because they WANT TO OWN the California utilities for pennies on the dollar.

So what does this have to do with BA's? Well - the press is going crazy saying now Californians have to conserve electrical energy. Laws are being discussed to make this manditory. It just might become illegal to connect anything with tubes into the power grid.

I could sit here in Texas and laugh until Jan 1 2002 when our energy deregulation laws kick in. Which, despite official denials, look an awful lot like California's. So, I guess TEXAS will be in the same boat shortly.

So here's the scorecard...

They deregulated the Post Office
Stamp prices went up

They deregulated the oil industry
Prices went up and there was an energy "crisis".

They deregulated Long Distance
Prices for Long Distance calls went up
Prices for local POTS went up

They deregulated Cable TV
The price of cable went up.

They deregulated the Airlines
The price of airline tickets went up (and there are less airlines)

They deregulated the power utilities

Well, you get the idea....

I'd be really surprised if he ever gets the money. <:-))
Money appears to be really tightening up for BAs on e-bay.
The rare ones in really outstanding shape are still bringing lots, but there
are a lot of really nice rigs that are not making minimum bid, or reserve.

Hey Harold,

B&W has been making antenna tuners since WWII that I know of. The
BC-939-A on my BC-610-E was made by B&W in 1945. Indeed a "nice
husky looking unit".

Dan N8ETQ CLE

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1208881823

Sorry for the cryptic subject. It just seems this would be the basis for a really neat
homebrew transmitter or receiver for portable use. This item is in reality an
International Crystal model 2400-0-2148 deviation meter. At least that's what I
think it is! It's in a nice metal cubic case 8x8x8 with latch. There is a deviation meter,
a channel selector, and a fairly decent vernier dial. The Channel selector has a
Weston thermometer built into it! Inside are 24 ceramic crystal sockets that have
(alas!) been relieved of their crystals. There is a very high quality 24-position
rotary switch and 3 very high quality ceramic variable capacitors, and a really
solid coil form. I would consider this a parts set, given the cost of recrystalling
it. But still a nice little unit to build into something. Could be a really nifty retro
portable tube ham receiver, or a transmitter-receiver. That's why I stuck it in the
'Transmitters' section - I think it would make a really cool little portable rig. The
vernier is smooth and more than adequate to track 40m CW around a fixed
rock transmitter. Also has a heavy carry handle on the case, and S0-239 antenna
connectors on the top - really perfect for a little rig.
Lotsa neat parts! Even has a robust battery holder inside.

Sorry for such a long post.

Take care

583. Wanted: Original mode switch knob for 210X

Newsgroup: rec.radio.amateur.boatanchors

its the Arabs, stoopid.
>
> They deregulated Long Distance
> Prices for Long Distance calls went up

mine went down.

> Prices for local POTS went up
Mine is still $8 and change per mo

>
> They deregulated Cable TV
> The price of cable went up.
Call ESPN and see how much they went up to deliver that one
service.

>
> They deregulated the Airlines
> The price of airline tickets went up (and there are less airlines)

Prices are still down and those that folded should have folded cuz
their price didn't include luggage arriving on the same flight.
>
> They deregulated the power utilities
CA has a unique situation because their utilities haven't kept up.

Pressure from 'mother's groups' etc have caused that de-regulated
industry to suck up to cheap rates and now they are paying the
price for that compromise.
A friggin 3br shotgun house costs 200k plus in any urban area of
Calif because of demand. The infrastructual demands in certain
areas oughta be delivering $500/mo bills to the residents.
Or they can move to Santa Fe or Albuquerque and start it all over
again.
>
> Well, you get the idea....

Yep, rough on boatanchor fans.

Bill,

There was quite a "to do" about this device years ago when they first came out. I'm curious to know what the values and configuration of the resistors are inside the box. My understanding of the device is that it is basically a swamping network. What do you think ?

KW, Model 108 ,TX Monitorscope.
Really excellent example, of this hard to find accessory for the range of KW2000 vintage HF transceivers. Made by Decca in the UK,back in 1974,(with a price tag, at that time, of $160).
Frequency coverage is 0.5 - 30 Mc's,and the power range over which it will function effectively is10watts to 2kW pep.It has a built in 2 tone generatorand is suitable for use with 50 or 75 ohms output transmitters.This unit is in 100% original condition,with absolutely no modifications.
Operation is from 115 volts ac.
The unit is in a very smart KW cabinet, which matches the KW transceivers,Linears etc.and is complete with a copy of the maker's handbook.Condition of this unit is virtually,as new.
Price,which includes packing and air freight to the USA,is $385 US Dollars.
Thanks for your time and interest. Graham Leo info@radio-exports.com

B&W still makes most of the parts you'd need to build a husky antenna
tuner. You might try their web site, http://www.bwantennas.com/

There's an email address there where you could inquire about tuners
they made in the past.

Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.shortwave,rec.radio.swap

This Hammarlund HQ180 is in excellent mechanical, cosmetic, functional condition. Cosmetically, I would rate it a 9 out of 10. All the tubes have been checked out and the radio was recently aligned. It is working flawlessly. The HQ180 is one of the finest shortwave receivers from the vacuum tube era. It's performance on shortwave is still comparable to some of the finest receivers today, and it's performance on the AM broadcast band is superior to all but the best commercial/military receivers. The HQ180 is somewhat unique due to it's triple conversion design, which gives it excellent selectivity without the ringing associated with tight mechanical filters. It is also known for its excellent slot filter for rejecting unwanted interference in the passband. I am including a copy of the operators & maintenance manual with this fine radio.

Nems-Clarke Model 1500A Series VHF receiver. Tunes from 55 to 260 mHz. Receives AM or FM transmissions. Front panel has planetary gear tuning knob with indicator, AF gain, IF gain, AM/FM mode switch, power switch, AGC/MGC switch, AFC switch, loudspeaker, tuning indicator, signal strength meter, and phones jack. The rear panel has 110/220 volt switch, AC power connector, ext speaker connection, antenna jack, fuse, and IF output jack. This is a commercial quality radio in excellent cosmetic and functional condition. As you can see from the pictures, it is very clean inside. I have used it to monitor aircraft, control towers, television broadcast audio, commercial FM band, 2 meter ham band, as well as signals on my TV cable. It works very well. I am including a copy of the owners manual, which includes operation, theory of operation, maintenance and calibration, fold-out schematics, and circuit pictorials.

Source record: 57306
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.shortwave,rec.radio.swap

I have used the HQ180 in side-by-side comparisons with an R390A using mechanical filters. Weak signals in the AM broadcast band and lower frequency (tropical) bands were often more intelligible with the HQ180. The (collins) mechanical filters of the R390A didn't respond well to the static crashes (QRN) common in this part of the spectrum. This is why the HQ180 is the receiver of choice for many medium wave and tropical band shortwave DXers.

601. FS:: SX-28 Power Xfmr

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-01-19 23:43:47 UTC
From: dharlan <dharlan@ameritech.net>
Message-ID: <3A68D133.25D807AD@ameritech.net>
Source record: 57311

Hello and Happy New Year,

I removed this xfmr from a real early SX-28
Chassis (has AC socket)
to replace the "Bad" one in my personal SX-28 Late model. It looked
like the 5VAC
rectifier winding on my SX-28 went open, and TWO bad 5Z3's and a flaky
meter probe
proved it! Well needles to say I have for sale a pretty darn nice
Hallicrafters SX-28
power Transformer that looks good and ohms out fine every way you care
to check.

One thing I did notice after removing the Xfmr from the "old"
chassis and having
my late model "Belly up on the bench" ; BUOTB ?) is that the Xfmr from
the old
chassis has the HV and 5VAC leads just coming out of the windings with
red and
green cloth covered wire, whereas my "new" rig has terminals for the
same wires.
The transformers are interchangeable of course and they both have
terminals on
the PRI and 6.3VAC side.

How about $45 plus 10 lb. of the shipping of your choice from 44134.

Thanks

Dan N8ETQ CLE

604. Crystals recommendation

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-01-20 02:22:42 UTC
From: W9STB <telegrapher@hotmail.com>
Message-ID: <01c08288$071120a0$c3b6313f@stb>
Source record: 57314

Many of you on this newsgroup have already heard my praise of PR Crystals, but lately I am seeing a lot of you back at the wailing wall desperately seeking FT-243s for your boatanchors. There is no need to get crazy about finding crystals. For years (and quite a bit during the past 12 months) I have enjoyed TERRIFIC service from Petersen Crystals (Petersen Radio Co., Inc.) 2735 Avenue "A", Council Bluffs IA 51501.
His product quality is consistently outstanding and his service is unlike any of the other crystals manufacturers.
Last year I called around to the big crystal houses and received anywhere from 3 weeks to 8 weeks in turnaround time with crystals ranging from $14 to $21 apiece. I work only 80 meter CW so I am not able to quote higher frequency crystals pricing.
I called Petersen and he took my order over the phone. When I asked if he took credit cards he very calmly said, "No....I'll just bill you."
Huh? I didn't know anybody was secure enough anymore to still bill customers!
He said he preferred to receive his orders via internet.
So gang, here is what the deal is:
He no longer does FT-243s BUT he does do HC6/U (Z9) crystals and will outfit the pins with a 0.093 inch pin to fit an FT-243 socket. (Request the 0.093 sleeves in your order).
He charges $10.50 per crystal and a flat $3.00 shipping/handling per order regardless of size.
I have ordered from PR now five times via the internet. I e-mailed him my order...and CONSISTENTLY it is in my mailbox never more than three days later!!!
With a bill. (Of course I want PR to continue serving us boatanchors guys so I always ship him off a check the same day I email him...after all he is probably wanting my check as much as I want his crystals, right?) But it is sorta neat to still have that old-fashioned trust involved.
Last May I ordered, among others, a crystal for 3540. I never used it until just a few weeks ago and for some reason it did not oscillate. I figured the statute of limitations had probably run out. This past Monday I emailed PR an order for another crystal and mentioned in my email if he had any suggestions as to why that crystal from last May wouldn't work unless I touched it with my finger. on Wednesday (WEDNESDAY!!!) when my crystal arrived he included a new replacement...no charge.
So guys, quit gnashing your teeth about boatanchor crystals. we've got a terrific resource in Petersen and we should support the fine little business he is running.
He prefers crystal orders via email. His email address is jjk51503@aol.com.
His phone is 712/323-7539.
I run primarily crystal controlled for both technical as well as

nostalgic reasons so it is important to my to not have to put up with terrible service and price gouging from many of the bigger manufacturers. See you on 3540X!

605. Re: Radioactive Tubes

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-01-20 02:55:54 UTC
From: Nick Kennedy <nkennedy@tcainternet.com>
Message-ID: <t6kk3gps2t6v78@corp.supernews.com>
Source record: 57255

I also suspected that the label on the tube was for radiation generated by the high voltage electron beam, as in a color TV. But I'm not an expert on all that goes into exotic tubes, so maybe there's actually radioactive material in some of them.

And I've seen the same stuff on "possibly contaminated" items versus activiated materials. It's a common misconception that anything exposed to radiation becomes radioactive itself. That's generally not the case. I work in the nuclear power biz, and people expect me to glow--but I have to disappoint them. Generally, it takes neutron bombardment to make this happen. And even then, not all materials will become activated (radioactive). I've seen stuff that was on top of a high power reactor for years and did not become activated.

Hi Guys,

It isn't strictly a BA because it doesn't glow but maybe someone knows this receiver. I just picked one up, the CRF 5080 model. It's very lively but noisy in the band swithing and pots. How do you get it out of the case? It isn't intuitively obvious and I don't want to break the thing. It has to come out to get at the components.

Thanks,

Pete/N9PT

From: Dick Koehl <koehl@anl.gov>
Message-ID: <94cqnscef1@milo.mcs.anl.gov>
Source record: 57332

Nick, and group:

I have seen several comments lately about radioactive tubes and what they might contain. This is my take on the issue...

This tube and many like it were very likely used in some kind of nuclear/military facility in which they would have been either operated or stored inside a "nuclear materials containment or boundary area". That in itself does not make the tube radioactive. It only makes it "suspect". Equipment thus used/stored can be safely removed and excessed provide thay can be surveyed as "clean" and the history of the used of the device can be well documented. (One could not excess a motor that used inside a "hot-cell".) However, once used/stored within such a boundary area, the equipment must be marked as "suspect". That is why you see the label "radioactive". The excessing agency is required to mark materials thus used. Suspect does not mean contaminated or dirty, it simply means that any radiation/radioactive material present in or on the device is "below the detectable limits" of the detectors used to scan for such contamination. There should be some markings as to the level of radioactivity on that label. Since current technology allows the detection of background radiation at 3 micro-R, or less (sheesh! A sunny day at the beach exposes one to 1000 micro-R!), chances are you have a clean tube. That label should show that "alpha-beta-gamma NCD", meaning if anything is present it is in such a small quantity that it is not detectable within the current range of the sensor/detector used, i.e, it is below detectable limits.

Whew!
So, I don't believe there is anything "inside" the tube.
The only commercial tube that I recall being radioactive (my experience with special purpose tubes is not extensive) was an 0G3. The 0G3 used krypton gas to regulate the voltage across it (it was used as a voltage reference) to 85 volts. Krypton is an inert gas that occurs natrually as the result of the uranium decay scheme. Some of the isotopes of Krypton are radioactive.

Hello there Lew ... I get about 25 watts on the Nye-Viking RF meter. Of course the same tubes have been in her since 1965. I have worked the world with my 723 with only a change in PS caps and a failed ceramic cap. I wish I could help you with the knobs but I don't have extras and I have seen very few 723s over the years and even less 722 VFOs. I was fortunate to have picked on up for 20 bucks a number of years ago. The power input on mine has not changed for about 15 years which leads me to believe that the 60 watt rating is "optimistic" of course a new output tube may be needed or maybe a drive osc reduction took place. 73 God Bless Tom KI3R Port Vue Pa. nr Pittsburgh

Where the tube has or hasn't been has nothing to do with it. There were a lot of tubes (new out of the factory) marked with a radiation symbol. A lot of the small voltage regulator tubes contain some radio active material as so marked. Some of the larger thyratron tubes used in radar modulators contain radio active material and also emit high values of x-rays when operating. (not that the two are related)

Source record: 57338

I second that, Vernon. PR came through as promised. Outstanding service. Great price. Excellent product.

Joe, W1GFH/6

<< Many of you on this newsgroup have already heard my praise of PR Crystals, but lately I am seeing a lot of you back at the wailing wall desperately seeking FT-243s for your boatanchors. There is no need to get crazy about finding crystals. For years (and quite a bit during the past 12 months) I have enjoyed TERRIFIC service from Petersen Crystals (Petersen Radio Co., Inc.) 2735 Avenue "A", Council Bluffs IA 51501.
His product quality is consistently outstanding and his service is unlike any of the other crystals manufacturers.
Last year I called around to the big crystal houses and received anywhere from 3 weeks to 8 weeks in turnaround time with crystals ranging from $14 to $21 apiece. I work only 80 meter CW so I am not able to quote higher frequency crystals pricing.
I called Petersen and he took my order over the phone. When I asked if he took credit cards he very calmly said, "No....I'll just bill you."
Huh? I didn't know anybody was secure enough anymore to still bill customers!
He said he preferred to receive his orders via internet.
So gang, here is what the deal is:
He no longer does FT-243s BUT he does do HC6/U (Z9) crystals and will outfit the pins with a 0.093 inch pin to fit an FT-243 socket. (Request the 0.093 sleeves in your order).
He charges $10.50 per crystal and a flat $3.00 shipping/handling per order regardless of size.
I have ordered from PR now five times via the internet. I e-mailed him my order...and CONSISTENTLY it is in my mailbox never more than three days later!!!
With a bill. (Of course I want PR to continue serving us boatanchors guys so I always ship him off a check the same day I email him...after all he is probably wanting my check as much as I want his crystals, right?) But it is sorta neat to still have that old-fashioned trust involved.
Last May I ordered, among others, a crystal for 3540. I never used it until just a few weeks ago and for some reason it did not oscillate. I figured the statute of limitations had probably run out. This past Monday I emailed PR an order for another crystal and mentioned in my email if he had any suggestions as to why that crystal from last May wouldn't work unless I touched it with my finger. on Wednesday (WEDNESDAY!!!) when my crystal arrived he included a new replacement...no charge.
So guys, quit gnashing your teeth about boatanchor crystals. we've got a terrific resource in Petersen and we should support the fine little business he is running.

He prefers crystal orders via email. His email address is
jjk51503@aol.com.
His phone is 712/323-7539.
I run primarily crystal controlled for both technical as well as
nostalgic reasons so it is important to my to not have to put up with
terrible service and price gouging from many of the bigger manufacturers.
See you on 3540X!

I have these in stock:

(8) 6JB6 Sylvania, new in the original boxes (one branded
RCA), getting quite hard to find, $19.50 ea.

(7) 6JB6A, 6 RCA, one GE branded Zenith, new in the
original boxes, $19.50 ea.

I have a bunch of other boatanchor tubes as well if they'll
do anyone some good. Check my site.

Thanks!

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1209301289

The above link is for a beautiful homebrew 8-tube ham receiver. I
bought it back in 1975 as a teenager and had it ever since. It's never
been turned on because the power cord is frayed, but judging by the
construction I'm sure it's well built and will run again. I set a reserve
on this because of my personal attachment to it. But I will NEVER
get around to restoring it, so it's time to pass it on to someone who will.

Take a look at it - this is a NEAT old 8 tube radio.

Dave

640. Re: Radioactive Tubes

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-01-21 01:30:54 UTC
From: Dick Koehl <koehl@anl.gov>
Message-ID: <94ddvd$e87$1@milo.mcs.anl.gov>
Source record: 57249

Nick and group:

If this is a repeat from an earlier response, sorry...but her goes anyway. Hopefully, I won't insert my foot in my mouth :-)

You may have the advantage over me here, Nick. The only experience I have with vacuum tubes involves small receiving types and moderate power transmitting types and a few higher voltage rectifiers. In my experience (30+ years?), there are only two places in which any tube would or could have radioactive material intentionally placed with it: the filament and a break-down gas. The gas, I've discussed. Some of the higher power transmitting tubes and rectifiers have Thoriated filaments to enhance the "boil-off" of electrons from the filament. Thorium is a radioactive material...a lot like depleted uraminum. But, it has characteristic gammas. If thorium is in the tube, any simply ionizing radiation detector will let you know. It is not a "weak" gamma emitter. The glass is not a shield and cannot stop the gammas from penetrating it.

Other than these two (2) uses, there is no reason to put radioactive material inside the tube. Doing so could quite possibly hinder normal operation due to the random nature of the decay and generation of ion-pairs which would be larger uncontrollable, IMHO.

On large power types, the radiation symbol, "triad" or "propeller", indicates that the tube will either generate non-ionizing radiation in the form of x-rays or RF(microwaves) when operating within it's normal parameters. X-ray generation occurs when electron beams come to a sudden stop on (in) metal elements.

I think your 577 is a mercury-vapor rectifier which could (and probably does) generate x-rays because it normally is used in 10 kV+ applications. The manufacturer is playing "PYA" by warning of the danger due to the misapplication of the tube or inadequate circuit design.

BTW, the tag on material exiting MBAs is yellow, with a violet triad, and is required by all government/military agencies and I suspect private agencies also. It simply serves to indicate the history of the device to the evenual user, and keeps it out of landfills.

Hi Dave....I received many comments on this thread via direct email and group postings. The group posting had referenced a QST archieve concerning the device that was most informative, but the thread no longer appears on my subject list. I received as many pros as cons on the matcher. It obviously is a compromise between a regular (cut to frequency dipole) and a broad band matching device so handy with today's multiband HF/V/U rigs. It does contain a balun and resistors which leads to the units lossy nature. The unit is still being manufactured today and I have heard from this distributer that advises it was a manpac matching device for frequency hopping and has utility where a quick set-up is necessary. I received this unit in December and have not tested it in any way yet. I'm interested in what the MFJ-259 will say when using various radiator lengths and frequencies. Many of the initial contacts were quite negative, but some utility shown up. WB4RFC is the dealer for these devices and confirms a strong military useage. I imagine this useage comes from fast idiot proof set-up. It radiates, just not nearly as well as a dipole. I would include the very informative QST site link, but I lost it when this thread was removed from the postings. Thanks to all that supported this thread.......Jack k8xx

Source record: 57260

Dave...I too own a fine 5100B and several times I have requested assistance on this board (and several others) for audio mods for this rig.

Those that did reply always shared the same response- no need to modify the audio, as the 5100B audio is fine.

There is a guy in Texas that runs a 5100B on 10 meters, his call is W5KD and his name is Mo (Maurice). Mo's 5100B sounds like a broadcast transmitter.

If you receive back any modification ideas, or can get ahold of Mo, I would be appreciative if you would pass along to me any mods you come across (I will do the same). I am about to tear into my 5100B modulator, as my audio level is far to low and I need to find the source of trouble first.

Thanks.
Emil

I had the misfortune to be in the vicinity when one of those radar thyratrons was broken several years ago. All present were checked for contamination and several of us had items of clothing and footwear confiscated. From the actions of the radiation protection folks I gathered that the radiation level was relatively minor, but anything which registered on their monitors was taken away from us.

Hard to find EV gold-anodized 664 microphone. Works well.
Less stand and cable. No reserve.

Thanks for the look.

Great Surplus!

The Hallicrafters Collector Association has been disolved due to some internal fueding and copywright issues. Several months ago, there was a single page on the HCA web site that gave the details on this. I believe that there is now a Hallicrafters thread on eGroups.com that you can subscribe to.

I believe this is a homebrew effort to duplicate a Radiola. Not sure.
I've had it since 1975 and will never get around to fiddling with it.
Appears totally intact, with all 5 Cunningham 301's in place and all
wires are well connected. No schematic or power supply.

Thanks for the look

Dave

Relm claimed they have no data on the Regency Ham equipment when I contacted them a couple years ago.

RELM=Regency Electronics Land Mobile, or business radios. They told me another company got the Ham and old scanner data, but wouldn't tell me who it was.

676. Heath SB-102 balanced modulator question

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-01-21 21:23:49 UTC
From: bruce <n9bh@svs.com>
Message-ID: <3A6B5365.1A09E975@svs.com>
Source record: 57183

The SB-102 uses 4 1N191 Germanium diodes in a ring type balanced modulator. Do these diodes need to be matched?

The symptoms: I am seeing 2 problems that may be related. One is that the carrier null trimmer capacitor has no effect; the carrier null pot does null the carrier when turned way to one side. The other symptom is that LSB is about 45 watts out while USB is about 100. There are only a handful of parts in the balanced modulator. Replacing all of them, with the exception of the trimmer, may be the way to go. Any suggestions?

Thanks,
Bruce N9BH

I have one of the FRG-7 that came from SEARS marked SEARS COMMUNICATIONS RCVR. Othe than the logos, is there any difference between the Yaesu trademark and the SEARS trademark units.
My operators manual has a different cover, but the inside is obviously Yaesu generated.

Very nice EF Johnson CB (I know this is a ham forum - but most of
the Johnson folks hang out here) walkie talkies from 1970. Work
very well, and include original leather holsters, service manual, and
owners manual. Everything works, including telescoping antennas.
Very nice pair of Johnson radios for a Johnson collection!

Thanks for the look,

Dave

I was wondering if anyone has any transceivers or transmitters / receivers Made by Western Manufacturing Company of Kearny Nebraska? These were little CW rigs made in the 50's through the 70's. They had ads in QST and some of the other Ham pubs. I am looking to by some.

Steve,

If you're not concerned about "collectability," Yaesu still sells
the fine tuning retrofit, for $3.70. All you need is a drill and a
soldering
iron to install.

Larry

Dave:
The contamination was probably from the tube filament. Some use a
THORIATED-tungsten or thoriated whatever. Thorium is a radioactive element
used to improve electron boiloff, I think. It also improves the brittle
characteristics of a pure metal filament such as tungsten, etc. There isn't
much in the tube(s).

Some gas/glow discharge regulators use an inert gas with naturally occuring
radioactive isotopes and are thus labeled radiaoctive. Most use an inert gas
which is not radioactive.Again, there isn't a whole lot of the stuff.

Might anyone help me in identifying this transmitter tube and its characteristics. It is air cooled like the 4CX250's but has rings at the bottom for electrical connection. It is about 3.5 inches in diameter. Please respond by email. Thanks Don Smith KB6GQA http://www.innercite.com/~desmith/Txtube.JPG

696. FS.RACAL Diversity (RA17/117)Unit

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-01-22 14:11:38 UTC
From: "radio-exports.com" <info@radio-exports.com>
Message-ID: <t6oftased89e10@corp.supernews.co.uk>
Source record: 57153

The Racal Dual Diversity Switching Unit,Type MA168,was one of the last "add-ons" (and one of the most useful) to be made by Racal, as an accessory for use with the RA17series and RA117 receivers.It was designed by Racal engineers to overcome the problems of signal fading.
This is a scarce unit,which here in the UK,at radio-ecports.com ,we do not encounter very often.
Essentially,it is an electronic switching device, which automatically selects the greater i.f.output from two receivers fed from two different antennas.
The unit is fully transistorised,has it's own built in power supply and will operate from both American and European mains voltages.It is designed to work with ssb,cw (and rtty signals etc., up to speeds of 1000bauds).The two signal paths through the unit can be monitored,by two meters on the front panel.
This is a very smart,compact, 19" rack mounting unit, only 1.75" high.It has been checked, tested on air,and is in full working order.
A copy of the very comprehensive Racal manual for the unit is included.
We would highly recommend this unit,which really does a great job of bringing up fading signals.
Price,which includes the cost of packing and air freight to the USA,is only $385 US Dollars.
For more information if required, or to order,please contact Graham Leo
info@radio-exports.com
Thank you for your interest and attention.

703. Re: RF attenuator for drivivng a Johnson Thunderbolt

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-01-22 15:35:04 UTC
From: Larry Menzel <retire@rconnect.com>
Message-ID: <t6okqr9gn91107@corp.supernews.com>
Source record: 57160

Question: Why do you want to do this in the first place?

The Tbolt is designed as an AM/CW amp, you CANNOT trancieve through it. You must have a Dow Key Relay or some such device to allow your tranciever to go back to receive mode.

There are many problems associated with using a modern tranciever with this amp.

My humble suggestion is that you sell the amp to an AM enthusiast and buy a modern amplifier that will be plug and play. You'll be able to get a good price for it as they are in considerable demand...should pay for a modern amp and then some. You'll be much happier with an SB220 or some such and have an amp you can trancieve through.

Good Luck

Larry, N0XB

Steve,

Just call Yaesu's parts department, you can get the number off
their website www.yaesu.com. I called them because I needed a power
switch. They seem to break pretty easily. I asked the guy what other
FRG-7 stuff they had sitting around, figured I might as well amortize
the shipping charge, and he found the fine tuning adapter in the
computer listing. I couldn't believe it! I knew they'd existed at one
time, but I didn't think they'd still have any. I got it but haven't
installed it yet. I don't listen to SSB too much and I think that's
basically the only need one would really have for it. I've got enough
digital boxes around so I if I really need a fix of SSB broadcast
right wing lunacy, or whatever, I can use one of them.

I hope they've got some left, though I'd vote that you keep
at least one non-fine-tuning one in your museum in pristine shape.

Larry

PS As for light bulbs, I remember reading on the FRG-7 message board
(An ok resource, by the way:
www.insidetheweb.com/messageboard/mbs.cgi/mb325495) that a guy was
able to find model railroad bulbs that were perfect replacements.

I have a Dentron MT-3000A antenna tunner. Yes this is the one with the two meters that handles the 2KW. It's in very good condition and would make a great addition to any station. $275+shipping

711. Radiosets history is needed

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-01-22 18:43:59 UTC
From: carlos.mascarenas@uca.es
Message-ID: <94i293$45c$4@mercurio.cica.es>
Source record: 57169

Hi to all:

We are making a Radionavigational and Radiocommunication Museum at the
Facultad de Ciencias N�uticas at C�diz University.

We have a group of radiosets without historical references and we desire joint

it near the radio apparatus for info to the visitors.

Could you help us?. I think that those sets could be of the 60's decade.

Navigation Echo-Sounder type 846V V M
Directional radiotelephone Trevin T15
Radiotelephone MF Sailor T122
Radiotelephone MF Receiver Sailor R105
Decca Navigator MK12
Radiotelephone and Consol receiver Phillips 27RR50
Weather fax receiver Koden (with fix channel-switches)
Radiotelegraphic Autoalarm 500 kHz AA4.
MF Radiotelephone MTR102ZA

And the "new" sets:
VHF Radiobeacon receiver Koden KS5150
Echo sounder Seafarer 4
Graphic and echo sounder Viking Marine DR200

All help will be wellcome and the helpers will be announced at the explanation

of each set.

Please contact directly with me.

Best regards.

712. Re: RF attenuator for drivivng a Johnson Thunderbolt

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-01-22 18:53:31 UTC
From: Gary Schafer <gschafer@mediaone.net>
Message-ID: <3A6C81A2.53E4D6DF@mediaone.net>
Source record: 57171

That's how you learn. By asking, doing and trying. That's what ham radio is all about. If we all just went out and bought a new radio every time there was a bump in the road then there would be no need for anyone to know anything. All those nice boat anchors would end up just holding some boats in place.

The Tbolt is a fine old horse for all modes.

Bill,
If you can't find an attenuator you can get it going by using a 100 watt dummy load. Put a T connector at the dummy load and a series resistor and then one to ground both of appropriate power levels.

You could just run from the T and dummy load straight to the amp and see how much drive you get. The dummy load will soak up most of the power. Still be careful with the drive level until you see how much you get. Also be careful when you switch bands as the amount of drive you get on one band may be considerably different on other bands due to the cable length between the load and the amp. The transmitter will not see a perfect 1:1 match this way but may be close enough to get you started.

Actually, it's a CBY-46129, which I have never heard of. Seems like it should be a BC-453 or something in that series, but apparently this is a different contract version and I am not all that familiar with the different service branch contracts.

At any rate, it's fairly rough and has no reserve, with a very low starting price.

Thanks for the look,

Dave

I recently acquired two pieces of equipment that I would like to get more info on. Both are labeled as Model 159 Megacycle Meter, made by Edison Electronics, a division of McGraw-Edison Company. Judging from the controls and meter marking, it appears to be a later version of the power supply-indicator portion of a Model 59 Megacycle Meter, grid dip meter. I would appreciate any leads as to technical information on them and also, dreaming, the tuning head and coils for them.

Thanks,

Wayne Hertel

Bruce-

thanks for the lead. What a fun place to shop at... Good thing they are not closer so I could visit them :) I went ahead and ordered up my connectors so I can make up a new cable. The HW was nicely built but someone else did this butcher job on the existing cable. Right now it's tube testing time, contact cleaning, replace a couple of leaky caps and generally cleanup while waiting for the connectors.

Yes, they should really be replaced with a matched quad. Unfortunately, matched quads may be hard to come by unless you have a large stock you can choose from.

I replaced the ones in my SB-102 (had similar problems) with 2 matched pairs from the same production lot. Sold as NTE type 110MP, these are Ge matched pairs intended for use in TV horizontal AFC circuits, and the 2 pairs all tested the same for forward voltage drop. Rig worked FB after replacement.

Good luck and 73,
Bob Weiss N2IXK

The carrier null pot's are usually all shot in all them sets.
Regarding the diodes you can buy 3 dozen 191's cheap at Radio Shack and
match em up on a DVM.
Them set a very picky about V5 and in V7 .....Westinghouse 6CL6's do not
work well

First let me say I usually don't make these posts and this is just a friendly warning. I recently ordered crystals from
Peterson Radio. I noticed a post here about good luck with his service. I ordered a total of 7 crystals for a Johnson
Valiant and I must say his service was prompt. I received my crystals in about 10 days and promptly sent him a check.
I didn't have a chance to test the crystals until the weekend and found 3 that didn't work. I emailed my findings to
Peterson and was promptly told "ITS YOUR PROBLEM". Following messages meet with the same reply. As I had said
Service was prompt, 4 of the seven worked and the other 3 "ARE MY PROBLEM".
Just a word of caution, these are as is "NEW"(fine Print).

I'll stick with the VFO in the future.

wrote:
Thanks Gary,
Lets see....where to start. I've had other people ask the same
question when I say I want to use the old t'bolt. Im 56 years old and
cut my teeth on old tube ham gear (remember tubes???) especially high
power amps. This in not to say I dont like the new gear, especially
the new transceivers. But when I try to operate these little
marvels.....big fingers, little knobs....I long for the old stuff with
big knobs, big meters, loud realys, and that warm glow you get from
the plates of 4-400's and 4-1000's and the like........something is
missing!!!! SO......I want the performance from the new transceivers
but I also would like some of the old "seat of your pants" operating
you get from the old stuff. I remember listening to the rag-chews on
40 meters on Sunday mornings as a kid and hearing the guys talk about
their gear......mostly am at the time but ssb was just coming into
use. I always liked the way the t'bolt "sounded" on side band and then
I got to use one when I went into the air force. We had all collins
gear and some home brew stuff using 4-1000's and the like and sorry
guys but I miss those old amps. Sooooooooooo my point is that I want
the latest transceiver but I also want a little bit of the past in my
shack just for the pleasure of operating the thing. When I made the
first post about the modifications needed, I knew basically what I had
to do to make it work, I was just wondering if someone had any new
ideas besides the obvious ones. I know some of you old times out there
know what I mean!!!!

732. Film strip dials

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-01-23 09:52:22 UTC
From: abloke <ok@last.com>
Message-ID: <3A6D5456.46A3@last.com>
Source record: 57192

Has anyone got experience of dismantling and cleaning the film strip dial on the R216 reception set.

I guess it is made from the same stuff as the RA17.

thanks

Andy

isn't this the unit that qst had an xray of the box, showing the internal components.Revealing that there were a pile of misc. parts epoxied inside , but not connected!!!
basically a big 50 ohm r , swamper, as you said, with a bunch of crap thrown in for anyone with an xray machine. kudos to the 'radiologists' at qst.

739. Hallicrafters Web Site

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-01-23 15:46:22 UTC
From: Halli <Please@NoS.pam>
Message-ID: <3A6DA74D.8AAC028A@NoS.pam>
Source record: 57199

Since there's been some discussion about the Hallicrafters Web Site and its status I asked Duane who's been the main player in the Hallicrafters Collectors group if he'd post something.

Here's his response to me:

==========
First, I do not subscribe to those lists. Perhaps you could post my comments for
me.

Presently, the Hallicrafters Collector's International web site is on hold. It
is not a closed group and nobody is being blocked or restricted. Presently
access is blocked to everyone. We are in legal negotiations and I am not able to
go into details about them.

It is hoped that the web site will be back operating within two weeks.

Much negative dribble has been posted by some malcontents who wish to destroy
for reasons of personal gain or animosity. I am sure you, and the others, have
seen some of it in various places. We who care, choose to not perpetuate it by
contributing to it or commenting on it. Doing so solves nothing.

The site will return and it will be open to all peoples, Hallicrafters fans or
not. It will not be restricted.

Thank you for your concern. I appreciate it, as do all of the Hallicrafters
fans.

Hello All,

I have an old 6 meter rig that has a pair of 6EA8 tubes in the receive section. The tube diagram on the bottom of the unit says that a 6EA8 OR a 6U8A can be used in both positions. My question is, which one is better for this application? I need to order new tubes for it, and want to know before I order. Any input on this would be appreciated!! Thanks in advance.

Greetings from Texas!

With all of the "Bad Guy" alerts being posted these days,
telling us who we shouldn't deal with, I thought it would
be beneficial to tell you who you should deal with!

I just completed a deal with Chris Katsoufis, VE3NGW/W4,
in Florida. I bought a Drake 2B/2BQ that he had posted
on the newsgroups a couple of weeks ago. The equipment
was exactly as he described it (both cosmetically and
functionally), he shipped it in a very timely manner,
and his email communications were friendly and timely.
I would not hesitate to deal with Chris again.

I would go for the 6EA8. THe 6U8 is famous for becoming gassy. Other
than that they are the essentially the same tube.

Hi All,
The good news is that I just got a Hallicrafters SX62A. I have the smoking jacket on and am looking MOST sophisticated as I tune in around the world with my brandy snifter in hand.
My question is: What is the band selescot knob supposed to look like on this model? Is it the round black knob? The round black knob with the chrome insert? Or is it the metal flat type? I checked Moore's books and Chuch Dachis' book and now I am completely confused (easily accomplished).
Does anyone out there have one of these rigs that they can check to see what I should have here?
rgds,
Mark S.

Source record: 57215

Chris - I've seen two versions, the knob with "ears" like on a SX-42, and a knob matching the other knobs with no skirt *but* having a shiny insert around the perimeter of theinside of the knob.

RUN, DO NOT WALK to the radio and replace all the crapacitors in the tone control circuit. The SX42 and 62 are infamous for frying their audio output xformers because if one the crapacitors in that circuit short, the entire B+ goes to ground thru the xformer. I've repaired 4 SX-42s and 62s with this identical problem.... and the stock Hallicrafters crapacitors are just that - crap.

Mark:

The Hallicrafters SX-62 was introduced in 1948 with the flat metal band switch knob. The frequency coverage of each band was marked on the panel around the knob and a line on the knob pointed out the tuning range selected. Later production SX-62 receivers were given a plain plastic band switch knob and the markings on the front panel were deleted. The SX-62A replaced the SX-62 in 1954 and was produced until 1965 when it was replaced by the SX-62B. The SX-62B only lasted for another year or two. The SX-62 series was made for about 18 years and the knob style changed several times over the years. You can get an idea of the age of your SX-62A by comparing its knob style with other Hallicrafters receivers introduced during the 1950s and 1950s. The latest SX-62's had knobs like the SX-111.

760. Tuning Hallicrafters S-38EM

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-01-24 03:08:38 UTC
From: Charles <charlesduncan@home.com>
Message-ID: <3A6E4739.C918B29F@home.com>
Source record: 57219

If anyone has any info on tuning a Hallicrafters S-38EM radio please email me back.

761. FS: my ARC-5 "collection"....

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-01-24 03:58:05 UTC
From: mcalhoun@ksu.edu
Message-ID: <94ljsd$bjf@unix1.cc.ksu.edu>
Source record: 57234

I have several ARC-5 items for which I've been looking for round tuits.
After "fondling" them all while looking for information someone wanted,
I've decided to face reality (my 60th birthday is next week, and I know
I have more projects waiting for round tuits than the world has round
tuits!) and sell the whole shebang. Here is what I have:

DOCUMENTATION:
* 1957 "COMMAND SETS" paperback book (the "Bible" for ARC-5 lovers?)
compiled by CQ/Wayne Green; it probably needs
little further description, but:
136 pages plus yellowish cover. Previously owned by K5JZJ and me;
our callsigns are scrawled on the cover and his on an inside page.
The two staples are a little rusty, and the cover is partially
separated from the binding just above the top staple. There are
a few pencil'd or pen'd notations on some internal pages

* Some 30+ ARC-5 magazine clippings from over the years.
QST: Jan & Jun/48, Jul & Nov/51, Mar/52, Jun/55, Jan & May & Nov/59,
Jan & Sep & Nov/60, Feb/63, May/67
CQ: Dec/UNK, June/53, Feb/54, May/55 (advert), Jan & Sep/56, Feb/57,
May & Dec/58, Apr/59, Jan & Mar/60, and Feb/61
RADIO ELECTRONICS: may/50
OTHER: five "articles" from arc5 listserver or similar

COMMON TO BOTH APPARENTLY-UNMODIFIED RECEIVERS:
Four stick-on flat rubber feet (undoubtedly NOT original).
Original ceramic antenna posts.
Original mica-insulated connectors on the rear.
No additional screw holes or connectors.
All screws are BLACK (stark contrast with aluminum case!).
"Spinner" knobs to right of dial are # 6748.
A few flecks of black paint are missing on the dynamotors.
Green felt under the lids; insides look spotless and shiny.
All parts, except as noted below, are present.

* BC-454-B 3-6 MHz Aluminum case; with dynamotor (serial # 73276)
Volume (?) control knob below dial is modern and is mounted on a black-
crackle plate that may have come from a black version of the receiver?
The top chassis has been bent and then re-flattened, but it was either
done during manufacture or by someone mighty skilled! (It would not
have shown in a scanned picture, and I didn't see it while holding/
examining the unit by itself; I only noticed it when comparing this
and the BC-455-B side-by-side, tilted to reflect the light!)
There are two metal tubes and four glass tubes.

* BC-455-B 6-9.1 MHz Aluminum case; with dynamotor (serial # 110651)
The volume (?) control knob below dial looks appropriate to the era
(fluted?) and is mounted on an aluminum plate
The top chassis, left side, has an oblong ding smaller than the diameter
of a pencil and about pencil-lead deep
There are tiny flecks of green (copper oxide?) on the safety (?) wires
which keep the dynamotor end-plates from unscrewing themselves.
There are six metal tubes.

COMMON TO BOTH OF THE APPARENTLY-UNMODIFIED TRANSMITTERS:
Original ceramic antenna posts.
Original mica-insulated connectors on the rear.
No additional screw holes or connectors.
Green felt under all lids.
All parts, except as noted below, are present.
No feet (rubber or otherwise).

* BC-696-A 3-4 MHz Aluminum case (serial # 29199)
The chassis has a few scratches on the left-rear end.
All screws are aluminum (no contrast with aluminum case)
except there are eight black screws on the left side.
The smaller adjustment-cover plug on the right side is black and
the larger is grey-ish (neither look like aluminum).
No provision for a "don't open" wire on the top-adjustment covered slot.
There are four glass tubes and a 3500 KC crystal.

* T-22/ARC-5 7-9.1 MHz Black-crackle finish (serial # 508)
The finish is perfect except for three VERY-small shinys on the left side.
Most screws are aluminum (stark contrast with black-crackle case!),
Both of the adjustment-cover plugs on the right side are black.
The "don't open" wire on the top-adjustment covered slot has been cut,
but the wire is still there.
There are four glass tubes, but there is no crystal.
There was a cobweb inside, but I brushed it out!-)

THE OBVIOUSLY-MODIFIED TRANSMITTERS ARE DESCRIBED SEPARATELY:
* T-21/ARC-5 ??? MHz Black-crackle; modified; (Serial # 4686)
The original dial has been replaced by an almost-professional-looking
plastic dial with (photographically?) engraved markings for the
various bands well-spread around the circumference.
Antenna post on front has been replaced by a screwdriver-adjust something.
The roller inductor and thumb-knob have been replaced by a frequency
selector switch (160, 80/20, 40, 15, 10), and I can see some kind
of turret assembly by looking through the larger/front top lid.
The original mica-insulated connector is on the rear, but the pins are
soldered to two coax cables terminating in an octal plug. Also mounted
on the rear are a small (filament?) transformer and two power resistors.
The rear lid has sorta ratty-looking green felt glued to it, and it covers
two glass tubes and a tubular, chassis-mounted capacitor.
The front lid has no green felt, and it covers one tube and an empty hole.
The larger adjustment-cover plug on the right side is black; the other plug
is filled by a screw which undoubtedly holds something "modern" under

the chassis.
The "don't open" wire on the top-adjustment covered slot is missing.
The finish is probably 99+% black, but it's dirtier-looking than the T-19.
One screw is missing.
Four rubber feet are screwed to the bottom plate.

* T-19/ARC-5 3-4 MHz Black-crackle; modified; (Serial # 1101)
The dial is NOT modified or written upon.
No antenna post on front, but a coax cable comes out a new rear hole.
The original mica-insulated connector is on the rear, but its pins are
soldered to a four-wire cable which terminates in an old tube-socket
(UX226!) acting as a plug.
There is no roller inductor nor thumb-knob (if that's what it's called).
The smaller adjustment-cover plug on the right side is black, while
the larger plug is missing altogether.
There is green felt under the rear lid, but it's not glued to the lid.
There is no front lid.
The "don't open" wire on the top-adjustment covered slot is missing.
There are four glass tubes and a 3265 KC crystal.
The finish is mostly there, but it's seen its share of use!
Many screws are missing.
Something rattles below the chassis, but I didn't take it apart to see what.

MODULATOR:
* MD-7 (I'm guessing; label is unreadable, but it's mostly Aluminum
and has a/an 5DY83AB1 dynamotor)
Upon closer examination, I see that the label isn't just unreadable;
it's not there at all!
The green felt under the lid is only partially glued to the lid.
The lid covers three tubes.
The dynamotor has apparently-unrelated dimples on each end, and the entire
unit looks like it has lain in someone's dusty attic for a LONG time.
There is one fuse on the "fuses" side and none on the "spare" side.

==========
Incidentally, I posted the above to the ARC-5 listserve earlier this
afternoon and I've already been offered (by different people):
$30 for the COMMAND SETS book
50 for the modulator
175 for "the whole kit and caboodle"
To save wear and tear on me, I'd rather send them all to the same address,
(and a local pick-up would be even that much less wear and tear!) but I
won't let that preference keep me from parceling them out to the highest
offer(s) and thereby "feeding" the TCS-13 side of my ham-radio hobby.
Tomorrow I plan to visit the local university (from whence I retired
several years ago) and "surf" the web looking for representative prices
others have paid in the recent past.

For Sale- Collins KWM2 transceiver and 30L1 linear amplifier, both winged emblem. in CCA very good plus condition. Must see to appreciate. KWM2 has been gone through by noted Collins technician and 30L1 has new HV caps and 811A tubes. Both operate perfectly. Prefer pickup so you can see and operate rigs, but will ship if you pay for shipping, insurance, and professional packing from North Texas (near Dallas). Comes with manuals and Shure 444 microphone. I have traced ownership of M2 from when it was new. $ 1700.00 or best reasonable offer.
Thanks- Dan N5NBK

766. Racal RA17/RA117 Sideband Adapter.

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-01-24 12:59:42 UTC
From: "radio-exports.com" <info@radio-exports.com>
Message-ID: <t6tkear40ek931@corp.supernews.co.uk>
Source record: 57224

If you have one of the excellent ,Racal RA17 series, or RA117 Receivers, radio-exports.com have just taken into stock one of the very best accessories for your set.
This is the "top of the range" Sideband Adapter, Model RA121 ,designed especially for these receivers,(though it could be used with any quality receiver having an i.f.output at 100kc's)
Toavoid any confusion,we should point out that this is in not one of the basic models,but is the one with a front panel which "looks like a flight deck "and includes a C.R.T.tuning indicator.Built to the usual Racal high standard,it is designed to receive USB,LSB,I.S.B,Pilot Carrier Signals,Supressed Carrier Signals and can be used for single sideband reception of double sideband signals.It is a most versatile unit.
Designed for standard rack mounting,it matches perfectly the Racal receivers.It does not require a lot of space,being a compact 5.25 inches high.At the moment,it looks really impressive, sitting on top of the RA17 receiver ,which we have been testing it "on air" with.
The condition of the unit is very good and it is in full working order.It comes complete with a copy of the maker's handbook.The price,which includes the cost of packing and air freight to the USA,is only $485 US Dollars,so you get a lot of best quality Racal engineering for the money.
For further details if required,or to order,please contact Graham Leo info@radio-exports.com.
Thank you for your interest and attention.

RE: "Be more specific. What exactly? Alignment? Getting the BFO to work?"

His question was clear and to the point. The term 'alignment' when used with the object 'S-38' has only one meaning. Perhaps you should respond only to posts of a less complex nature.

The gadget you're looking for is called the -hp- 8708A Synchronizer.
Cost in 1972 was $1950, more than the 606B ($1730) or the 608F ($1940).
The 8708A works with either the 606B or 608F, but no others in this
sig gen family. It had a stability of 2X10^-7 settability, and covers
50 KHz to 430 MHz. You could conceivably roll your own if your signal
generator has an FM input that goes down to DC.

I haven't seen one in years. Tucker Electronics doesn't seem to have
any, but you might let them know you're looking for one. Their phone
is 800-527-4642.

Message-ID: <XvHb6.40896$YQ.8140094@typhoon.southeast.rr.com>
Source record: 57238

Hi folks,
here's another
==========
TR-7 s/n 8015
front panel and knobs are very good, no blemishes seen, the same for the
PS-7 s/n 7367 front.
I have checked this one out, and used it a bit, but have not done any
alignment, as "they" say abt TR-7's, "if it works, don't mess with it".
Power output is good on all bands, about 100w, down to about 70-80w on
10,
which seems to be about typical.
The inside of the TR-7 is nice and clean. Much nicer than my "keeper"
TR-7A.
The cover had some corrosion bubbles in the paint. I have cleaned &
sprayed
it with texture paint, as has been recommended.
The PS-7 cover is similar, I have cleaned & sprayed it, looks very good.
No dings on the outside of the p.s., it's clean on the inside, and has
the
original Drake final inspection tag, dated 6/2/80.
Price for both units, $575, - plus shipping costs, I'll pack. incl. manual
copy.
It's probably an "Excellent Condx" unit. as listed by Thom
LaCosta/Donnie,
wa9tgt, on 9/22.

Message-ID: <FzHb6.40898$YQ.8143993@typhoon.southeast.rr.com>
Source record: 57239

Hi all again,
Here's another
========
T4X s/n 11867
Front panel is very good, no scratches or rubs. nice knobs. key jack
is in
the bottom center (original).
There is a short, fine, crack in the meter plastic, doesn't go all the
way
across, right at the left side, below the "zero".
chassis does have some black spotting, about "medium" I guess.
It loads up to 250-280ma on all bands, pwr out from 60 to 90w.
It has an extra xtal in it, for 10m cw, but it's not an exact one, it's
38.955, so the dial is off by 145 kc. usable, but a pain to remember just
where
you are. e.g. 28.000 reads 28.145.
top cover has some extra holes in it, maybe it had a fan or 2 on it.
And it
could use a spray job
the holes in the top would bring it down to "good condx" from "very
good" I
think, as listed by Thom LaCosta/Donnie, wa9tgt, on 9/22.
Price w/o pwr supply, $135 - plus shipping. incl. manual copy, I'll pack.
add $40 for an AC-3 (not sold separately)

Hello,

I have some LF-antenna's and I will sell these antenna's. The antenna's came
from a submarine. It are 4 bars of ferriet. On these bars there is a coil.
The specs from these antenna's are:
- Frequency 10 Kc to 4 Mc.
-Length is about a yard. (90 cm)
-Weight is about 5 kg. It is the weight of the antenna.
-The weight from the house and antenna is 25 kg.

There is documentation, but I must read it for another specs.
I have pictures too.
If you are interested send me a mail and I give you a answer.

Frans PB0AKY
Netherlands.

Source record: 57242

I just picked up an S-120. I thought I might try getting it working for fun...if I can. I'm not very deep in Electronics but poke at it. So far the main capacitor was bad, replaced with 'close' (4 seperate) units. Note a resistor gets very hot in series with first -50c5 tube ...suspect its bad--next will test all tubes....any experienced help out there?

My KWM-2 operated well until recently. First, it would not load on 40 Meters, but the receiver worked fine. There was no meter reading in any position and no output noted on the watt meter in either the Tune or Lock position. I tried it on 20 and found that it loaded OK. Back to 40 and it then worked normally. This cycle happened once more. Now, I turn it on and the meter pins in all positions and there is no audio. Any suggestions?

Source record: 57101

The first thing to check is the three relays, expecially if they are open frame. I suspect the antenna relay could have been the first problem, but now it could be the others. Next check for proper bias voltage. If you are using a 516F-2 there is a little square selentium (spelling?) rectifier under the chassis. If its voltage is less than about -80 vdc, you have a leaky rectifier. You can bridge a 1n4007 across the rectifier and see if the voltage comes up. REMEMBER, this is a bias circuit so the diode is backwards and the cap have the + going to ground.

These are good places to start.

I forgot, you should check out the contacts on the bandswitch. especially the in the final cabinet.
Make sure all the contacts make in every position. you could have one section slightly out of alignment and it doesn't make all the time. That could explain the 40 meter transmitt problem.

You can take the little cans of to check the switch positioning, but they must be re-placed to get proper tuning. Do not cut slots in the bottoms. You have to take the bandswitch shaft out to get the covers off. Be careful not to pull the center out of a switch section. You could quickly have a parts radio. BE double careful replacing it. It goes out the back.

Interesting pair of Russian code keys from the Soviet days of the
Cold War. Acquired from a ham in Ukraine a few years back, both
were used on the air and work great. The first one listed has a really
good feel - very solid hand key. Low starting price with no reserve.
Great for a key collection or everyday use.

Thanks for the look,

Great Surplus!

From: pds83@yahoo.com
Message-ID: <94pal8$b36$1@nnrp1.deja.com>
Source record: 57109

Ok, here's the problem. I did what is described as a "Crystal Oscillator Frequency Andustment" on my Layayette HE-35 (6 M AM rig, all tube) I did it according to the directions in the factory owner's manual I have for the radio. Everything appeared to be OK, but I didn't check it completely until the following evening. The next evening, I checked it with a frequency counter to find that it was transmitting at 47.6 MHz !! I then "retuned" it back to 50.4 where it should have been, BUT my power output (according to the meter on the radio) dropped off drasticially! Before I had the bright idea of doing this in the first place, it was putting out about 6 watts according to the meter at 50.4 Mhz. The two main things that I "tweaked" were what the manual described as the "crystal oscillator coil slug" and the "transmitter tank output coil slug". These adjustments were changed drastically during the process, as they have quite a few threads on the adjustment screws. There were also two other adjustments made, but they weren't as "drastic" and they were the two variable caps -- one is for TV interference, and the other is for antenna "matching". The adjustment is narrow on these compared to the coil slugs...

Anyone have any ideas on how to get this thing back to where it was?? There must be a general "starting point" for the coil slugs, as they weren't "pre-adjusted" when the radio was built. Unfortunately the manual is limited as far as alignment info goes, and I don't have a service manual for the radio.

Any help / ideas would be appreciated.

802. Bendix MN26 Radio Compass (1930's)

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-01-25 16:41:32 UTC
From: "radio-exports.com" <info@radio-exports.com>
Message-ID: <t70lq7dfvvov91@corp.supernews.co.uk>
Source record: 57110

Widely used in military aircraft in the early years of WWII,the Bendix MN-26 Radio Compass first appeared in the mid 1930's.
It will operate as a conventional receiver (coverage 150kHz to 1.5MHz),but its primary function ,is as a direction finder.
Here in the UK, radio-exports.com have just taken one of these splendid items of airbourne equipment, into stock.
Externally,the set looks much like any other wartime boatanchor-just good tidy condition.However,the inside of the unit is something else!
The internal "architecture" of this classic boatanchor can only be described as superb.Beautifully finished,symetrically laid out,precision under-chassis wiring,all main components readily accessable,it has an aura of expensive,high quality,precision engineering.
The tube compliment is 5 x 6K7,2 x 6N7,2 x 6J5,1 x 6L7,1 x 6B8,& 1 X 6F6.and the unit has a built in dynamotor.
We have had one or two Bendix Radio-Compass's over the years,but this one has has the best interior condition which we have ever seen.It is no exaggeration to describe the inside condition as "brand new old stock".
The MN-26,like most similar aircraft radio equipment, is designed for remote control.Band switching is electric,and tuning is via a flexible drive.
Very fortunately,we also have the correct Remote Control Box (Type MN-28) together with the flexible drive cable which will be included with the set.
This is a really super piece of kit, in a fine condition which is almost unobtainable today.It will probably be a long time before you see another one like this!
The price for all of the above,including packing and air-freight to the USA is just $415 US Dollars.
If you would like more information or wish to order,please contact Graham Leo info@radio-exports.com

820. CC-AWA Winter Swap Meet, this coming Saturday

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-01-26 01:27:25 UTC
From: Ron in NC <kc4yoy@pop.trellis.net>
Message-ID: <01c08737$5ba27b60$1d4896d0@ron>
Source record: 57130

CC-AWA Winter Swap Meet, January 27, 2001
Caughman Park, Columbia, SC.
The park opens at 8am so there's no reason to arrive early.
This is a FREE event, NO admission

Here are directions for the 29 Jan swap meet at Caughman
Road Park in Columbia, SC.

>From I-77 go to exit 9 if you are coming from the south and 9A if you
are coming from the north. Either way you are at US 378/76 EAST,
also called Garners Ferry Road.

>From I-26 go to exit 116 (from north or south). This is the southern
end of I-77. Go north 9 miles to exit 9 and follow directions above.

>From I-20 go south on I-77 from either east or west on I-20. Go to
exit 9A and follow directions above.

At I-77 and US 378/76 there are several motels and restaurants.
Motels include:

Holiday Inn Express 803-695-1111
Days Inn 803-783-5500 or 1-800-325-2525
Hampton Inn 803-783-5410
Economy Inn 803-695-3485
Sleep Inn 803-776-6263

To get to Caughman Road Park:

Go east on US 378/76 from I-77 4.5 miles to the seventh (7th)
stoplight, including the one at I-77 and exit 9, but not the one
caution light.

Turn left on Trotter road and proceed one (1) mile. You will see the
main entrance to the park on your left. DO NOT ENTER HERE.

Go to the next street on your left (about 300 yards), which is
Caughman road and turn left. Go about 200 yards and there is a
parking lot and a large covered picnic area on your left. This is
the place.

We have this part of the park from 8 a.m until noon. DO NOT ARRIVE
BEFORE 8:00, please.

Restrooms do not open until 10:00 so lay off the coffee.

Information Carl Shirley 803-776-6850 or shirleyc@garnet.cla.sc.edu

Date: 2001-01-26 02:31:45 UTC
From: Henry Kolesnik <wd5jfr@oklahoma.net>
Message-ID: <t71ocke29rk8ad@corp.supernews.com>
Source record: 57131

depending on the radio you have the xtal and filter will determine which
sideband you detect..
for example in the collins 51s1, it has usb and lsb filters one above 500
khz and one below 500 khz ..
with 2 filters dsb is possible..
in the collins 75s3 you have only one filter at IF frequency and 2 xtals one
above and one below that determine which sideband will be detected..
after saying all that you migh want to invert the detected usb or lsb to the
other..
i've not seen a device that does that but if there's one we might hear about
it here..
cheers

822. TVI 6 Meters

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-01-26 03:04:24 UTC
From: "David J. Moge" <n1rzb@mailops.com>
Message-ID: <3a70e8ab@excalibur.gbmtech.net>
Source record: 57132
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.boatanchors,rec.radio.amateur.digital.misc,rec.radio.amateur.dx,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

In brief, I have a multi element TV antenna with a amplifier connecting to 4 televisions. The house lot is laid out in such a way that it's very hard to string antennas up with out having them in close proximity to the TV antenna. Cable is not an option. Satellite is possible but would like to keep regular TV antenna.

At Christmas I found a Six Meter rig under the tree.(MFJ 9406 SSB/CW 10 Watts) which my wife gave me. I put up a dipole to try it out and to my surprise it works quite well. With a antenna tuner I have a 1.3:1 SWR.

My wife hasn't stopped yelling at me sense. Every time I key the mike or try out CW the TV's go blank. I have tried a HI PASS filter but that doesn't do much good at all.
My HF rigs cause no problems at all. I do have a good RF ground

WHAT AM I DOING WRONG??? HELP!!!

Any comments and suggestions would be gratefully appreciated.

Thanks

Really neat looking old Hickok RF/TV Marker generator with a green tuning eye. Granted, not many folks need an analog tube type TV generator these days, but this is one is SO pretty it would look nice just running on a shelf somewhere! Seems to work fine, so far as I can tell. The tuning dial slips in places, but otherwise seems pretty flawless. Check out the photos at teh above link - lots of pictures.

NEAT looking old unit! Even if you don't bid, just peek at it. They don't make 'em like this anymore! (Ok - I have soft spot for how gear back 'in my day' looked - I think it's neat!)

Thanks for the look.

Anybody using broadband antenna amplifiers are just asking for
trouble. If it has a frequency response something like 47 .. 860 MHz,
then there is no wonder that it is going to saturate :-).

Are you absolutely sure you need amplification for VHF channels ?
Wouldn't it be sufficient to put a UHF only amplifier directly after
the UHF antenna and just use a passive summing network to connect the
VHF antenna into the downlead ?

If this is not possible, but Band I is not needed (channels 2 .. 6 in
the USA), put a high pass filter around 150 MHz immediately in front
of the preamplifier.

If Band I channels are required, put a 50 MHz notch filter immediately
in front of the amplifier and make sure the amplifier has a good
metallic cabinet so that your transmitted signal does not go directly
into the amplifier.

You can make a good inexpensive notch filter by placing a 1/4 wave (on your 6M operating frequency) long piece of coax, shorted on the far end, across the input to the amplifier.

830. Re: TVI 6 Meters

Newsgroup: rec.radio.amateur.boatanchors

Source record: 57139

R. L. Drake used to make a real good low pass filter exclusively for six meters. If you can find one (probably at a hamfest) it will help but not totally abate your problem. If you use it in conjunction with removing your TV antenna distribution amplifier it should help measurably. If that doesn't work, you may want to try the above two "fixes" along with good quality high pass filters on your televisions.
I hope this information is of some help to you.
73 and good luck.

What good will that do ? I thought a 1/4 wave translated a short to an open.

What is your SWR without the tuner?
All the suggestions I just read are good. Especially the Amplifier
part and the stub idea.

Try getting the swr nice and flat without a tuner.

There is NO REASON a tuner should be needed on a 1/2 wave coaxial fed
dipole. Unless your operating way off its frequency. And if you are,
that in itself will contribute to the TVI problem.

Cool project! 475 plate volts in plate-modulated AM service isn't
pushing it too hard.

If memory serves, the 12GE5 is just a 12DQ6B in a single-ended
Compactron bulb. The capacitances may be a bit off, though. If you need
full specs I'll dig out the RCA manual.

If you have to buy tubes, you might consider converting to the 'DQ6
family if they are cheaper or you have some. I did this to another
ham's Heath HW-16 many years ago because a 6GE5 was several dollars and
I had a box full of 6DQ6Bs. He eventually unconverted it when he found
a NOS 6GE5 at a flea market for a buck.

OPEN on the far end!

Best use a piece of 'large' coax. I've used 3/4" cable TV hardline.
It's notch is wide enough that you should cut it low in freq. to keep
from killing any TV2 signal. Cut it for 49 - maybe 48 mcs --- you
can always cut long coax shorter, but you can't cut short coax longer.

Make that 1/2 wave and you might see a notch :-) on that frequency
(and remembering to compensate for the velocity factor) if you are
using shorted stubs.

A 1/4 wave _open_ stub could also be used, but it is harder to tune.

> I have a pair of old Simpson 75's....

My Sylvania manual (1953 vintage) says the 75 and 75A are a dual triode, typically used as a detector amplifier (Hmmmm!). Plate volts 250, 0.9 mA Plate current, and then we see why..... the Plate Resistance is 91000 Ohms. Neg. grid volts = 2.0. Has amplification factor of 100.

Sounds like a good net float to go along with a good boatanchor. Or a cool amp for the favorite crystal detector.

Don

Hi Randy,

Haven't hear you for a while. I found a bought a Drake TR-7 the
other night. Don't ask me why, but it works nice.

What do you have new and what if anything do you have for sale?
Maybe a speaker or something for the TR-7?

Replace ALL the paper type capacitors! Mouser has some great
capacitors for this. There CDE type and are small in size and low in
cost. You can go to there web site at http://www.mouser.com and get a
free cd-rom of all the parts they carry. You could also use Sprage
Orange drop capacitors and these are very good but they cost more than
the CDE cap's and are huge in size. The CDE cap's rated at 600 vdc are
a good replacment for all the paper type cap's. Good luck!

>that in itself will contribute to the TVI problem.
>

Try feeding the dipole so that it has balanced RF current.
use a Balun or make a pawsee stub at the feed point
a Dipole if cut right is about 70 ohms so SWR 1:1.3 is about
OK with no tuner (the PA in the rig should handle this with out
shutting down)

From: "David J. Moge" <n1rzb@mailops.com>
Message-ID: <3a72d6df@excalibur.gbmtech.net>
Source record: 57074

In brief, I have a multi element TV antenna with a amplifier connecting to 4 televisions. The house lot is laid out in such a way that it's very hard to string antennas up with out having them in close proximity to the TV antenna. Cable is not an option. Satellite is possible but would like to keep regular TV antenna.

At Christmas I found a Six Meter rig under the tree.(MFJ 9406 SSB/CW 10 Watts) which my wife gave me. I put up a dipole to try it out and to my surprise it works quite well. With a antenna tuner I have a 1.3:1 SWR.

My wife hasn't stopped yelling at me sense. Every time I key the mike or try out CW the TV's go blank. I have tried a HI PASS filter but that doesn't do much good at all.
My HF rigs cause no problems at all. I do have a good RF ground

WHAT AM I DOING WRONG??? HELP!!!

Any comments and suggestions would be gratefully appreciated.

Thanks
DAVE, N1RZB

Sticking a needle through the shield and the centre conductor is a
reversible operation, cutting the coax is not a reversible operation.

I have no idea the application or spec's of this little filter, other than to presume it to be 455 kHz center frequency. I removed it from a defunct SSB generator ages ago and never used it. Has three leads on each end, one of them soldered to the mounting frame.

Outside of that, you're on your own as to what to use it for! Starting bid is $5 so surely someone can find a home for it.

Thanks for the look.

Hi

Cutting a stub to the correct length is like playing Russian roulette.
The alternative is to cut the stub shorter than the calculated length
either quarter or half wave and use a small trimmer capacitor. Use one on
the input to the Amp and one on the out put as well. My experience
suggest that most on the damage occurs in the TV set mixer.
you can locate a stub if necessary at the TV set as well. I have had a
good results with co ax and trimmer it is very easy tune. After a while
you can simply guess the length of coax and tune the trimmer.
Regards Alan
VK3ry

Take some kitty litter in a large trash bag. Please the book inside
with the pages fanned open. The litter will absorb much of the smell.
(suspend the book out of the litter, not in it.)

Dave, the 6 meter band's fundemental frequencies fall close to the
video portion of the television
signal. Plus, you're probably experiencing what is known as fundemental
overload. Your tv's are
acting like a receiver for your nearby 6 meter transmission. The tv's
don't have the proper
filtering to filter it outand reject that signal. The FCC sees Amateur
to non-amateur interference as not necessarily the fault of the
amateur. Usually, it's the fault of the manufacturer of the consumer
electronic device for not puttting in the proper filters and shields.
If there are no supurious emissions
from your station, then fundemental overload is the culprit. The ARRL

RFI book may give you some ideas on fixing the problem.
Did you try choke filters ont he tv(s)? That amplifier may be letting
in extra signals, too.
Good luck.

869. Pye Westminster Help.

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-01-27 18:48:07 UTC
From: Martin John Hallsworth <Martin@g1gyc.demon.co.uk>
Message-ID: <980621941.6686.0.nnrp-01.9e98acde@news.demon.co.uk>
Source record: 57078
Cross-posted to: alt.ham-radio.vhf-uhf,alt.radio.amateur,rec.radio.amateur.boatanchors,rec.radio.amateur.homebrew,sci.electronics.misc,sci.electronics.repair,uk.radio.amateur

Hello,
I was having a root round in the shed I have come across an abandoned project - it is a Pye Westminster, I have no longer got information on Westminster's and this is a "special" set ie it is not a W15FM the set is not a Whitehall before you all jump on that it is FM only has 10 Tx and 6 Rx channels I think it is most likely half of a 2 rig set up and is remote controlled.

It is longer than a W15 by 4 or 5 inches (100 - 125mm), the standard PA strip has the final transistor stage missing and in the extra space at the back of the rig is an add on amplifier stage (High power I think maybe 25 watts or more) and a "current limiter" PCB.

The ID plate has the following markings
Cat N° AT90148
Ser N° 81493
Code BL01 VEEX

from the code number I remember it to be
"V" spec IF filters (25Khz)
"E" band Tx (68 - 88 MHz)
"E" band Rx (68 - 88 MHz)
I do not know what the "X" means
Can any one identify what this rig is and more importantly has any one got details or circuit details. I am looking to use the PA for 50 Mhz on my FT690
so any help much appreciated.

Thanks Martin G1GYC

Sorry, read the wrong tube specs...here is the skinny.

Horizontal Deflection Amp. Beam power Pentode 12GE5.

DC PlATE VOLTAGE MAXIMUM 770VOLTS.
PLATE DISSIPATION MAXIMUM 17.5 WATTS.
AVERAGE KATHODE 175MA

It does not give the plate current. Hope this helps.

This instrument is in fair physical condition. There is some sticker residue on the panel and enclosure. I checked it against another voltmeter and it's working fine. The back panel has buffered AC and DC outputs to drive a chart recorder or other instrumentation.

Last one of those I saw was back in 1970's and it was a W30AM. The valve at the back was a quick heat PA with a TX invertor on the centre section. I linked one up many years ago and used it on 2M but invertor whine used to be a big problem on mobile use.

I have the manual somewhere in the loft if you're serious about it.

Probably has a label on the hinged cover which says "10TR6" and either A
or B (though I can't remember which was which). I had a pair of these
and modified both to full ten channel operation. If we're lucky someone
will explain how they were used with a twin control box labelled
"PLATOON" and "BATTALION".

>It is longer than a W15 by 4 or 5 inches (100 - 125mm), the standard

W25FM I think was the designation.

Ten channel.

>Can any one identify what this rig is and more importantly has any one got
>details or circuit details. I am looking to use the PA for 50 Mhz on my
>FT690
>so any help much appreciated.

Ah. Well I was going to say "treat it as a W15FM until the last stage,
then follow your nose for the PA". What I almost certainly don't have
is details of the PA stage. If it still has the original crystals and
you have the right equipment you should at least be able to get an idea

of the drive level and thus the feasibility of using with your FT690.

One thing to bear in mind: there's no particular reason why the PA should be linear in its original application so be prepared for that as well as adding turns to coils or whatever to bring it down to 50MHz.

If you can identify the final PA transistors that might offer a better route to getting a suitable circuit.

Dan

>In brief, I have a multi element TV antenna with a amplifier connecting to 4
>televisions.

>WHAT AM I DOING WRONG??? HELP!!!

You are more than likely overloading the amplifier. I suspect the amplifier is broadband covering from ch 2 to at least ch 13, and possibly UHF 14-89. Channel 2 is in close proximity to the six meter band. If you can get decent reception without an amplifier, that would be a start. If not, you will need to build (or obtain) a notch filter or high pass filter to go right in front of the amplifier.

Good luck and happy sixing.

I noticed you said radios, and not books but you didn't describe the vintage or origin of the radio. Some of the surplus radios were treated with an agent to somewhat preserve them. If this is your case, please be very careful until you fully understand what you are breathing.

If your instance is just concerning "old" radios, I would expect them to be tar & nicotine filled which can trap odors and sometimes preserve the metal from further oxidation. It's a mess to clean up, but can be done.

Good luck.

Have had at over a douzen W15FM for different bands to experiments
with, also a douzen F30FM - with R17FM, and R18FM receiver, a T100MN
transmitter, an AM25-B, AM25T Vanguard (converted to FM) buying boards
from B. Bamber, and some Cambridge FM10d's

Tried to convert it to 6m, but the problem is that - if you increase
the capacitance across the coils on the exciter it will be rather
sharp tuned and will only cover few channels. Nominal RF o/p from the
exciter is 0.15W, not sure if this applies to your version

have much experience using F30FM, and the most important to start with
is to add ground connection on as many points on the different pcbs as
possible, also using ground lugs on fastening 6BA screws. This even
improved modulation with the T30FM transmitter

The T30FM wouldn't give more than 12W, but a simple modification
adding few capacitors iimproved this
R18FM may operate fb on 160MHz, but when you try to use it on 2m, it
will never be optimum, a BF905 imrpved the squelch setting for 10dB
quieting by a figure of 3, you also must add tape under the cover in
RF converter.

It is two different versions of W15FM, the first (1967) has bipolar
transistors, while the second (1968) has JFET in receiver converter

I never liked the power amplifier in W15FM, it is too old design and
can be improved a lot, at least you can obtain far better devices, so
for the two metre version (LA3VHF) I used BGY36 power module

John;

Dollar to a donut that it is just a dirty relay. It probably has the open relays like mine.

Every few years I have to slide the transceiver out of the cabinet and clean then. I just saturate some paper strips with a good tuner cleaner and pull them through each relay contact. Good for another five years. Rig is 40 years old and still working fine.

hope this is it.

The W25FM was an export only version as I remember, but like as not the 'export' also included the MoD.

On a 13.8V supply they were spec'd to do 25W continuous, but 35W was more common, and I've even seen 'em do in excess of 50!.

As someone said, treat it as a W15FM, including the PA alignment - it is only a higher power version of the normal PA output stage.

Let us assume that the interference is really being caused by your very strong 50MHz signal getting into the antenna amplifier via the input connection (I'm sure that this will be the main cause, but it may not be the only problem). However, what you essentially want is lots of attenuation 50 - 52MHz, and as little as possible elsewhere. However....

Using coaxial stubs CAN be very effective, but there are several serious problems with simply adding a simple o/c quarterwave or s/c halfwave stub across the input of the wideband amplifier. These include:
1. The width of the notch will be so wide (even with the lowest-loss coax you can find) that you will also kill the TV low-band (Ch2 - 55.25MHz - will, of course be the worst affected).
2. As well as having a notch on 50MHz, here will be notches at odd multiples of 50MHz (if quarterwave) and all multiples (if halfwave). This may make a bit of a mess of several other TV channels.

The obvious solution to the width problem is to make the notch narrower. With stubs, you can do this by cascading similar stubs, each separated by a quarterwave of coax. This will also greatly increase the depth of the notch. A single stub will give you a notch of 25 to 30dB, and two stubs will increase this to nearly 60dB (I doubt if you'll need anything like this). However, this will not change the 'harmonic suck' effect (although these sucks will also be narrower).

You cannot eliminate the multiple harmonic sucks, but you can move them around so that they do not fall on those frequencies which you want to receive. You can do this (for example) by adding capacitors or inductors in the appropriate places (I won't go into this here).

You will probably be better off with a circuit using only capacitors and inductors. However, there will need to be more to it than the simple equivalent of a single coax stub. I have a typical circuit in mind, but you would have to calculate the values or do some 'jiggling' to values obtained by means of 'inspired guesswork'!

Having said all this, I'm sure that you are not the only one having trouble with 6m hitting TV (antenna amplifier or not). I wouldn't be surprised if there are several off-the-shelf filters which are purpose-made, and don't cost too much. If not, let me know - I'll move to the USA and set up in business!

73,
Ian.

Right, for further amusement go to <URL:http://www.deja.com> and search
for T10R6 (using settings of "all" and "complete"). You will then find a
previous thread abouty these things, though it won't help with your
project...

[...]

>No Xtals in it I think I got it at a rally for £10 because it had no Xtals,
>control box, mike or cable

It will work with standard W15FM control gear, should you want to go down
that route, or could be converted to "local" operation, particularly if
you only want one channel, eg for packet or whatever. Getting the full
ten channels is just a matter of fitting the full-length oscillator board
and completing the wiring, though where one gets 10-channel boards from
these days I don't know. Real pity about Garex disappearing...

>OK The transistor is a TRW PT4236c

Unfortunately can't find data on that (or any other TRW devices - did
their RF transistor business get sold to someone else?) on the web. You
probably need to track down someone with an old databook.

i need identification help, please..
at least i think it's German..
i picked up 2 of these at a hamfest..
looks a little like a metal 6L6 but longer..
it's probably aluminum painted black, 6 inches long, 1.25 inch diameter..
the base is similar to an octal tube base but has space for 14 pins, only 8 installed at factory..
only 4 pins have solder in them..
it's probably an electrolytic but could be a relay or a filter..
here's what printed on it..
AEG
RUNDFUNK
GLEIHRICHTER
360 B 200 Rs
F 612 2/48
GNB 10/360/200 R
I1y 50724

from the weight and feel i'd guess it's a plugin electrolytic capaacitor..
the ohmeter readings are not convincing and maybe they're dead electrolytics..
anyway, just curious..
maybe someone knows..
tnx

From: Reg Edwards <g4fgq.regp@btinternet.com>
Message-ID: <951gmj$ot6$1@plutonium.btinternet.com>
Source record: 57026

Just connect it between the single tube and speaker. It will work quite
normally without any more than the usual noticeable distortion.

Most of the distortion in due to non-linearity in the output tube anyway.
If as is usual the output transformer is included within the feedback loop
then there will be no problems in any case.

Regards, Reg, G4FGQ

I have a number of crystals that I acquired as part of a larger purchase. They are Type 376M and are of various frequencies around 2.150 MHz and some in the 3.2 and 3.6 MHz range. I have a photo of an example at http://tcimet.net/~shs/xtals/xtal-1.jpg. Anybody know what they are for? Do they have any value?

Any help would be appreciated. Thanks in advance.

Dave -

Traditionally, 6m has been the best way to get the "Worked all channel 2's" award. Various low and high pass filters, even (maybe especially) those that are effective on HF tend to be ineffective on 6m. The main problem is that 6m sits right in the middle of what would've been TV channel 1. TV sets tend to have RF front ends that are very poor in terms of strong adjacent channel signal performance. Also, TV's are usually poorly shielded (how many 15KHz harmonics can you count?) so 6m will be picked up by the power wiring and the TV circuitry itself!

What to do? I can't say what if anything will work for you, but here are a few things to try. I'm assuming that your 6m rig is clean, so my suggestions all apply to the TV system. 6m harmonics should not be much of an issue even if present because they impact only one VHF TV channel (11 I think). The basic goal here is to reduce the 6m signal strength at the TV's, TV amp and TV antenna.

1. Move your 6m dipole as far from the TV antenna as possible. The dipole is physically small (10' or so long), so this ought to be easy to do.

2. Keep the 6m and TV ant cables as far apart as possible. You say that you get an SWR of 1.3:1 WITH a tuner? Better to adjust the 6m dipole so that you have a low SWR *WITHOUT* the tuner, assuming that you're feeding the dipole with coax. If this turns out to be the problem, a "current choke" balun at the dipole may also help. If you're feeding the dipole with twinlead, you need to be more careful about what is near the twinlead's path from the antenna to your radio. In either case, the idea is to prevent the 6m antenna feedline from radiating.

3. Orient the 6m dipole so that the TV antenna is directly off the end of the dipole. Putting the TV antenna in an antenna null is the simplest way to reduce the 6m signal level at the TV antenna.

4. Choke/filter the AC power lines feeding the TV amplifier and the TVs. Radio Shack (and others) sell a ferrite core for this. I think they're fairly inexpensive - $3 for 3 or so...

5. Build quarterwave stubs tuned to 6m and install them at the antenna inputs to the TV amp and the TVs. This will selectively reduce the 6m signal level to the amp/TVs. It's possible that the only one you'll really need is on the TV amp - assuming that it's the only box being overloaded. If channel 11 is used in your area, the stub may also affect it. If so, the stub may not be a good idea. (BTW, the halfwave stub

suggested elsewhere would also affect the 2nd harmonic of 6m. Lucky for you, 100MHz is not a TV channel. Unlucky if you're using the same antenna for FM broadcast!)

Good luck. Enjoy 6m!

927. Help I.D. old Astatic Product?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-01-28 19:21:52 UTC
From: mailfrmpa@aol.com
Message-ID: <20010128142152.08522.00001281@ng-cv1.aol.com>
Source record: 57036

I have been looking thru old QSTs of the '50s trying to identify this piece of Astatic electronics. I believe it is a converter or pre-amp, probably for television or F.M. radio. It is in a mahogany-tone metal cabinet; the front panel has a round dial marked "fm" and #'d 6-2, from the 6 o'clock t the 12 o'clock position. From 12 o'clock to 6 o'clock it is #'d 13 to 7, and labeled "commercial." It has (1) tube, a 6AK5. The rear terminal strip is labeled "From Antenna," and "To Receiver." There is a major sub-assy labeled "Mallory InductoTuner."

Anyone know this thing?

TNX,
Kï¿½MB

940. Re: Info WTD: Elecktrisk Buro EB5001 ship's RX

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-01-29 03:07:16 UTC
From: "G. Skiffington" <"skiffing@nbnet.nb.ca"@nbnet.nb.ca>
Message-ID: <E75d6.3290$TR6.104543@sodalite.nbnet.nb.ca>
Source record: 56900

Howdy Roger.....I was wondering when I'd see an Elektrisk Bureau station or components come up on boatanchors heheh.....I really don't have any specific info any more but did work as R/O on a few vessels that used 'em . The EB5001 receiver, I "think" was a rebadged Skanti receiver, but would have to see a picture to be sure. EB was a Norwegian outfit, built good quality, sturdy equipment. The schematics took some "getting-used-to" as they used a lot of european symbols and often didn't show any connector physical layouts.....so it was a good R/O's (and/or tech's) job to make a pile of notes. Heck, even the manuals were big robust affairs, with metal back binding! A typical setup for an EB station used 1 or 2 receivers, 1 or 2 exciters (maybe 100mW output) which generally covered the range of 405-518kHz and 1.6-29.999 Mhz. The higher freq ranges however were often "band-stopped" to a broad range of international maritime mobile freqs. They could be, however, modified to include, for example aeronautical or company freqs (my experience). Unmodified exciters, as I recollect, would hit 160 and 80 meters ok due to those freqs also being used in maritime mobile service in other parts of the world (from North America). Modes were A1, A2, A3H and A3J (USB only). A1 and A2 were only available in 405-512kHz. The companion transmitter (typically an EB400 or EB1500) was mounted remote from the main console and was often even in a seperate "emergency" radio room near the base or feedpoint of the antennas. The lower section of the main transmitter typically housed a battery charging and change over switching arrangement and was fed either by 220 vac 3 phase or 48vdc. The receiver you mentioned would be powered by 220vac 1 phase or 12vdc (via a regulator typically). The exciter/transmitter setup was autotune...you selected your freq and hit the tune button....the sound of ratchetting "ledex" relays and switches greeted you and she was ready in a few secs. The R/O's console also included, typically, fairly elaborate telephone patching to ships phone system and often had provision for radiotelex interconnect......Full duplex was available for HF patches (isolation was a little touchy but could be made to work very nicely). Don't know what you have.....but the receiver should be an easy one to get running (and a good performer).....the exciter and TX could be a challenge - not for the faint of heart. There were also dedicated MF transmitters (maybe THOSE were the EB400) used as a standalone 405-512kHz station. EB console also included an "Autokey" distress alarm keyer and an "Autoalarm" 500kHz receiver with decoder (which would ring a bell in Sparky's cabin!) if an alarm were received (500kHz) during off hours. Transmitters were generally 400W to 1Kw output (low exciter output was 50 ohm coaxial cable along with a bundle of bandswitching/keying lines to the TX).

Best of luck...sure brings back fond memories.

Gord Skiffington VE1AJF (when we still had a hobby) and R/O (before the GMDSS wizards got ahold of it).

It's a TV booster (Preamp), and uses a Mallory Inductuner as the tuning device. It tunes from Channel2 through 6, through the FM band, and through all the special services stuff, then continues into Ch.7, and tunes through Ch.13. Nice little gadget. The 6AK5 is the preamp tube.

I have an early SX62. It has the round knob with the metal insert in it. Later versions of this set had the same gnob, sans the metal insert. I suspect that yours is a late enough model to have lost all of the metal inserts to "progress". Mighty nice set, nevertheless.

They are just very old crystals. The one in the picture appears to be in excellent condition.

In the 50's I had some of the same type along with many other configurations. I used to spend my evening grinding them into the ham bands. The obvious great thing about these earlier crystal holders is that you can get into them.

Nice find!

Don

948. Help! Need 1962 rev Manual or copy for EFJ Desk KW

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-01-29 04:33:33 UTC
From: Joe Eide <jeide@execpc.com>
Message-ID: <3A74F29D.3F005286@execpc.com>
Source record: 56908

Can anyone help me find a manual or copy for the 7-62 revision of the EFJ Desk KW?

I am trying to put one together from a couple basket cases and the parts are very different.

Thank you,

Joe Eide - KB9R

949. Estate Tubes Available

Howdy from Texas,
I have just finished cataloging the tubes from the estate of a local ham, now SK. There are more than 300 types and more than 1500 tubes total. You can view the list here, www.ditdit.com .

These seem to me to be frequency standard crystals for some kind of
signal generator. Not the same as 1 MHz standards but reference
frequencies
for a test bench or something. The frequencies you mentioned are in the
range of what was used for maritime AM transmitters.

All the above my guesses and are probably wrong.

I have this neat little swr/power meter......it appears sturdy and very well made.

Made by Quement, model number is SWB-3.

It appears to function.....yet for the life of me, I cannot figure out how to use it.

Is there anyone out there who has this exact device, that can tell me how to use it?

Not sure of that number, but if its the little dual meter one with
a knob in the middle, you simply adjust the knob for full-scale on
the left side meter and read the SWR directly on the right side
meter. I had one like it branded as Calrad...it seems to have
sold under many different brand names. Cheap, but functional.

I still at the moment have 2 HRO5 National receivers with full sets of coils for each and coil crates, 1 dual rack mount power supply, and 1 home brew single supply (not doghouse). The condition of the receivers are 8 and 9 in my opinion. These are from an active station of a now sk since last summer. He was a engineer / ham and had quite an antique station. He kept up well on his gear. I would prefer to sell the both receivers at once but will consider breaking them up. I may also have some extra tubes and original manuals but those are presently stored somewhere else. I will forward what I find however. $450 per receiver or $800 for the pair plus shipping UPS from 02458. Thanks and 73s Lew KlNDV

Hello.. Tonight a friend gave me an old reciever of some sort..and I am hopeing that somebody can give me some insight on it..
Would A schematic,or a copy of an owners manual be available online somewhere? (and would anybody know where?!)
I still have yet to pull the tubes and check them,but I blew the dust out of it,and it fires up,all the tubes glow,and the meter on the front panel moves around a bit..?

I'm going to go connect a speaker,and an antenna to it now.. hopefully I will be able to hear something!

It says on the front panel

Model R-4B
Reciever
R. L. Drake Co., Miamisburg, Ohio

There is an R4B owners manual on line at BAMA - URL:
http://bama.sbc.edu/drake.htm

Also See the Drake Museum at URL:
http://www.dproducts.be/drake_museum/r-4b.htm

Also there is the R-4A Owner & Service manual and a R-4C Owner & Service
manual
at URL:
http://www.dproducts.be/drake_museum/manuals.htm

Many manual vendors will sell a manual for a reasonable price -- see URL:
http://ac6v.com/manuals.htm

Excellent old receiver. Have fun.

Patrick,

Point your web browser at "http://www.yahoo.com" and do a search on
"Drake R-4B". I got about 80 hits and of those, about a dozen were
places where you can get manuals and schematics.

On line, take a look at "http://bama.sbc.edu/drake.htm". There is
a listing for the R4B. I see a owners manual in PDF and JPG format.

By the way, nice receiver.

That's a great receiver. A good place to view its history is at the
Drake Virtual Museum http://www.dproducts.be/DRAKE_MUSEUM/
That site has links to many other Drake-related sites as well.
I don't think RL Drake supports the R4 series anymore, their URL is
http://www.rldrake.com/

Good luck!
DT

Hi Patrick,

Ditto what Mark said about the rec.radio.amateur.boatanchors NG. A post there will get you all the info you want. However, I can tell you a bit about it.

Your friend gave you a real nice unit! It is a ham band only receiver for CW (continuous wave morse code), SSB (single sideband voice), and IIRC AM reception. Mostly tube, but I believe it has a few SS diodes in there somewhere. The R4-B was normally paired with the T4-B transmitter. The pair could be configured to work as a tranceiver using just one of the units to control the frequency of both. Or they could each tune to different frequencies. The ultimate in flexibility. This was and still is considered to be an excellent reciever. If you want to unload it, I'm sure a post on the boatanchor newsgroup would garner a number of offers.

Best regards,

Steve Robertson, KE4OH

Hello All,

Here in Cleveland, Oh. there were two. Jeff-Tronics was my favorite.

A pretty old building (even back in the mid-sixties) with a creaky wooden floor and that fabulous smell of old radio gear. In the late seventies Dixon's Radio and Key was the place to be.

As a teenager in the 50's I used to ride my bicycle down to Henry Radio on Olympic Blvd in West Los Angeles. They had rooms with new equipment that you could try out, but the real attraction for me was the used equipment. They had rooms for Xmtrs and Rcvrs. I used to drool over the used Hallicrafters, National, and Hammerlund receivers stacked from floor to ceiling in those rooms. I'd buy, maybe, a CK-722 for $.99 or some other component for the project I was building and ride back home to listen to my 3 tube regenerative receiver.

I was in LA on business a few years ago and had some time to kill. I stopped by the "new" store on Bundy. What a disappointment, but I guess the nature of their business has changed. Candy stores just are not what they used to be.

Don't forget Henry Radio in LA. I bought a used Collins 75A-3 there in 1959 and flew home to northern California on a Lockheed Electra, with the radio under my feet as carry on luggage. Some guy wheeled in an excellent KW-1 and it sold in ten minutes...but not for the $25K some people are getting for them nowadays.

Has anyone been in Fair Radio Sales in Lima, Ohio recently? I stopped by there around Christmas 1968 and it was the last real surplus store I ever saw - dark corners, unidentifiable stuff on the floor, the smell of MFP and excellent prices. From their web page it looks like they have a mix of stuff now. See: http://www.fairradio.com/

I grew up in a suburb of Wilmington, Delaware. I thought I was in heaven because we had both a Lafayette Radio store AND a Radio Shack store within one mile of my family's home! As you might imagine, a whole lot of my lawn mowing, paper route, and babysitting dollars ended up being spent at those two establishments! Ah, the good ol' days. I sure miss Lafayette Radio...

Don,

I just got into the BAMA a few seconds ago, after reading your post on the newsgroup. Try this URL as a lead-in...

http://www.bama.sbc.edu

...then navigate the site from the main page. Works for me.

Don,

Dean is correct, you can use the web page address to access
the schematic archive. I don't like using it because it often
cuts me off part way through a download. I get the first couple
of pages for a manual and then it starts denying access.

This is due to the nature of URL access and the fact that there
is a very low limit on the number of users. I prefer to use the
direct FTP approach, like you. Once your in you won't get
booted out, until your done downloading. The only problem
with your address is that it may be old. The correct FTP
address is:

ftp://bama.sbc.edu/downloads/

Then "cd" to the boatanchor of your choice.

The news is on the arrl webiste, http://www.arrl.org I don't often visit
that site, but I was wanting to know the price of "200 meters and Down"
yesterday, and checked the news while I was there. His death was last
week, I think the 24th. I was a little surprise that I didn't read
it in the newsgroups first, because that is how I've heard of the passing
of various important hams over the past few years.

I got a 19th edition of Bill's Radio Handbook for Christmas in 1972,
me being 13 years old and licensed for six months. I had an ARRL
Handbook at the time, but I didn't have many books about electronics
or radio. Somehow having a hardcover handbook was a big event. ALmost
thirty years later, that edition beats out the other two I've bought
since. And while I used and abused it as a kid, it's still in pretty
good shape.

Cool.. I now have a schematic,and am downloading the users manual..
any idea what it would be worth? it seems to be in pretty good
condition,except that the power cord has been cut,and there is a new plug on
the end.. its only about a foot long!
I'm not sure if I want to sell it or not,It seems like a pretty nice piece..

Just curious to know what it might be worth?

While we are plagued from time to time with technical problems, BAMA
is very much alive. No problems with lawyers. In fact manufacturers
have asked that their legacy gear be documented on BAMA.

I'm sorry that Don is having problems and he certainly isn't alone.
Remember that BAMA is a web "front-end" for an ftp site. While almost
an infinite number of folks can visit the web site at "almost" the
same time, only five can be actually connected to the ftp site at any
one time. With IE 5.5, keep clicking on the "Refresh" button and you
will eventually be connected to the ftp site. With Netscape, click on
the "Reload" button. To avoid the hassle of clicking repeatedly, try
using an ftp client. You don't get to see the html coding, but it is
pretty poor in any case and by using the ftp client you become a
certified computer geek. :-)

Please feel free to visit BAMA and download any of the Boatanchor
manuals without charge. Thanks to Boatanchor enthusiasts from around
the world the collection continues to grow.

73,

Ken K4XL

Here in Detroit our 50's/60's candy stores were M.N. Duffy, Reno Radio,
RSE Ham Shack, Lafayette Radio (sorta), all in the downtown area.
Also had surplus heavens, Silverstine's, and Lambrecht's. Probably
a few more I've forgotten. Often spent Saturday mornings making the
circuit, just to see what was new, or what had been traded in.

"Bad smell" is a subjective term, but in many cases the source of bad smells in old radios is ordinary mildew. Often it is combined with layers of household grime, such as cooking grease, tobacco residue . . . the crud of the ages. Mildew is easy to identify. It smells like a stinky old wet basement.

There is no miracle substance that magically and instantly removes all dirt and bad smells from old radios.

I have had moderate success in deodorizing things such as mildewed old magazines and books by sealing them in a plastic bag with about a quart of activitated charcoal, available in pet stores for use in aquariums. Leave your stinky paper stuff in the bag for a couple of weeks and it will come out smelling better. I have never tried that with an entire radio. For one thing, the moment you turn on an old tube radio, it begins to heat up, which may dissolve old grease and grime, dissolving and releasing more smelly crud, etc.

A thoroughly clean radio will not smell at all. A good household cleaner will get rid of much grime. You can use anything from mild soapy water to Windex to Formula 409. I always start with the gentler cleaners and work up from there.

Use paper towels, old toothbrushes, Q-tip swabs, toothpicks, etc., to loosen the crud and reach into small crannies. Be patient and don't hose down any moving parts with too much liquid unless you're prepared to disassemble, clean, and lubricate them later (not a bad idea, anyhow).

If your radio chassis is still filthy and smelly, the next step is a solvent such as mineral spirits (paint thinner). It will dissolve crud that milder cleaners won't easily get. Beyond that, you're getting into more hazardous materials that require caution. I have used everything from pure lacquer thinner to acetone, etc., to remove horrid messes from old radio chassis, but I wouldn't recommend that anyone start with those, for obvious health reasons. You need to keep the junk off your skin, work with excellent ventilation, etc.

NOTE that some radio chassis were plated with toxic materials such as cadmium, which are now considered a health hazard. Before you power up any motorized buffers to remove old crud, consider that you may be inhaling carcinogens or spraying toxic dust around your workshop. Some old radios even have asbestos sheets (for heat resistance) between the chassis and the wooden supports.

Avoid steel wool at all costs. You may leave miniscule shreds of metal fluff inside crucial components, rendering them useless and making the radio

difficult and expensive to repair.

Cheers.

> identical problem.... and the stock Hallicrafters crapacitors are just
> that - crap.

AMEN to that, and while you're at it, replace ALL the paper/plastic
capacitors in the whole set. If the 62's bandswitch is anything like the
42's, there's serious danger of frying your bandswitch, as well. You can
read about what I had to suffer through to fix the burned bandswitch and
tone switch on my SX-42 at http://antiqueradio.org/halli07.htm.

Sure, it looks like a lot of work. But if you want to use your old Halli
regularly and reliably, you need to set aside some time and chug through it.
Tips on replacing capacitors at http://antiqueradio.org/recap.htm .

Cheers.

South Normanton & District Amateur Radio Club,
in Association with the G-QRP Club, will be holding
"Junction 28 QRP Convention" on Saturday 17th March 2001
at the Village Hall Community Centre, Market Street,
South Normanton, near Alfreton in Derbyshire.
Just 5 minutes from Junction 28 of the M1 motorway and the A38.
This will be a traditional radio event, organised in the true spirit of
amateur radio.
All under cover, there will be lots of traders with components, kits,
vintage and radio surplus, plus special interest groups and club stands.
Lectures throughout the day from Rev.George Dobbs G3RJV,
Rob Mannion G3XFD (PW editor), Tex Swann G1TEX (also from PW)
and Douglas Pitt of the N.B.T.V.A. (Not to be missed!)
Hot and cold food and drinks will be available, plus a licensed bar.
Talk-in will be provided by special event station GB0LOW on S22.
Doors open 10.00am. Admission is just ?1.00. Free prize draw.
Further details from the organiser on 01623 465443.
We look forward to seeing you there!

1034. Get involved. See the Tower of power!

Even our little 'dog-crossing' town of Charlotte had a good
surplus store, at least up into the 70's when I moved away.
Surplus Electronics run by Bill Cornell, I think the fella was.
Later his son ran it.
They were on E. 3rd or 4th @ Cecil St. (later-Kings Dr). back in
the 60s, then later on S. Blvd near Tremont and I think somewhere
else in-between.
I had some great finds in there. It was a
bring-your-own-thermos-of-coffee and a flashlight kind of place.
One of the more notorious things was what appeared to be the
complete inventory from the Hammarlund plant closing in Mars Hill,
NC. I found the complete 160 meter coil set for my HX-50A...they
had these coils by the hundreds! I also stocked up on a bunch of
the 60Kc (or was it 50?) IF xfmrs for my -170 cuz my teenage ham
hands were always cracking the slugs trying to tweak more DX out
of the radio.
Does anybody else remember this one?

-Bill WX4A

In the Washington, DC area the "Electronic Equipment Bank", better known as EEB, was the local Candy Store. A real ham store, they sold tons of new and used gear, and also carried an extensive line of swl receivers. A very cool place. They were big in swl mailorder, but the ham business was mostly local walk-in. Closed for years, now; I still see some of the old staff at hamfests in the area. Great while it lasted.

Hi all, been following this thread for a while. Can't remember their
names but there was a sorta radio row/surplus in San Antonio, TX in
the late 60's early 70's just off the downtown area. Any one remember
Texas Surplus Sales which was off WW White and was the state surplus
outlet ?. And lastly the sorta candy store that I have not seen
mentioned is Burnsteen Applybe (sp) last one I remember was the one
in the Citadel Mall in Colorado Springs Co in the early 70's. Good mix
of RS type new stuff and JUNQUE as well as ham gear.

I tried to retrieve the schematic for a piece of boatanchor Collins gear a year or so ago and Rockwell prevented such information from being disseminated free of charge. Don't recall the site or what schematic I was looking for now. Might have been the Collins Museum at http://www.wa3key.com/collins.html

"History Of Ham Radio"

Aslo includes a listing of about 50 Antique Ham Radios with links to
photos and descriptions -- Squires-Sanders, World Radio Labs, and Harvey
Wells.

About 20 old radio catalogs listings - who remembers Olsons and
Concord??
And common component manufacturers of the day (40-60's) Trimm headsets
and Sarkes Tarzian stuff.

This RADIODAN's own amplifier (HENRY is building me something different). It uses a 3CX1200A7 and is in excellent condition. 160-10M incl WARC bands it easily puts out 2000+ watts for 100 watts drive. About 75 watts gets you 1500 watts out. This amplifier is very special compared to a regular production amplifier in that is has THREE vacuum relays (one in the out as usual, and the input and bias relays as well are vacuum). The reason for this is very quiet relay operation and perfect timing at any speed CW or data. Also it has rubber mounts on the DC choke and plate transformer for no hum or vibration. $2700 + shipping (most shipping USA is about $200). Professionally packed and shipped from HENRY docks.

Beautiful condition HENRY 3K ULTRA (1.8-30MHz continuous). Uses the very rugged 3CX1200D7 Eimac tube. Has vacuum output relay. Continuous coverage means WARC and MARS frequencies are no problem as well as any HF Ham band. This unit has no hours on the tube as it was built for an engineer to design a different control head for. It comes with a BRAND NEW control head. You can purchase presets if you wish. Only $3500 + ship. (shipping to most USA is $200-250). This unit will be professionally packed and shipped right from the HENRY RADIO docks.

Not dumb Dick, but a lot of fun. I am new to boatanchors, but like
RadioDan said look for the simple things first. Capacitors most often
need replacing, followed by resistors going bad. I would check those as
well as looking for the pbvious wire before buying tubes. Good Luck.

<snip>

The good news, though, is that Rockwell Collins has in fact given the
CCA permission to publish the material in question. The even better
news is that the CCA has decided to make the information freely
available. Check the CCA web site for for the details.
http://www.collinsradio.com/
While you don't have to be a member of the CCA to download the
manuals, service info letters, etc., if you are a Collins collector,
you should consider joining the organization.

Source record: 56975

I have forsale an E.F. Johnson Viking Valiant. Condition is an 8 out of 10. Works good and the audio is great from on-air radio checks. Comes with a 4 pin wired Astatic D104 Silver Eagle mic. Reason for this modification is that the unit came without a mic socket.

Reason for sale is I am a CB operator working to my General Class license but I need money for college. I had been scolded by the Ham operators in town for owning and operating this unit. I don't want any trouble with the FCC since I'm not a qualified Ham yet.

I am located in the Mojave Desert about 2 hours from Los Angeles, 1 hour from Bakersfield and the same to San Bernardino/Ontario areas. I can meet any interested parties halfway.

Price for this unit plus microphone is $450.00 firm (not including tech repairs to get this unit working). I'd like to do a face to face transfer of this unit because it is too heavy to ship. But if you're really looking forward to buying this unit, you must pay the shipping from my Zip Code. I will only sell this unit to Ham Radio Operators and Ham radio operators only... so please email me your callsign so I can verify you through QRZ.com. Thank you for looking and 73...

AC

P.S. I can send a Jpeg of this unit if you so choose. First come first serve...

AFAIK,the open 1/4 wave cable is a short circuit for the concerning frequency.Though he should take the frequency of the tv-channel for the 1/4 wave calculation.

1067. FS.HF Transmitter Driver (Redifon)

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-02-01 12:15:34 UTC
From: "radio-exports.com" <info@radio-exports.com>
Message-ID: <t7ikr470n7nnbf@corp.supernews.co.uk>
Source record: 56977

We have just taken into stock a very nice HF Drive Unit made by
REDIFON,Model GK203.
Frequency coverage is 0-30 MHz.
The desired frequency is set up in the conventional manner, on six decade
switches.There is a rotary setting switch for each of the following: MHz
tens,MHz Units,KHz 1000's,KHz 100's,KHz 10's & KHz Units.
The unit has two input channels,each of which has an independent speech
compressor.
Modes catered for include CW,AM & SSB (usb and lsb).
There is a built in test facility and a meter which is switched to monitor
the levels of drive into the unit and the r.f. output.

This is a rugged,well made equipment which is clearly designed for
commercial use.(Redifon is of course a presteige name in the UK and Europe.)
It is designed for standard 19" rack mounting , has a 7" high front
panel,and is approximately 15" deep.
The front panel looks very smart ,as all the lettering is crisp and
clear.All control knobs are present and all are original,as is the panel
meter.
We have powered up the driver (it will run on both US 100-125volt & European
200-250 volt supplies).
When set to it's middle frequency of 15.0000 MHz,the actual output was
15.0008 MHz,so it will obviously require a little re-setting of the
calibration.The r.f. output,which is adjustable,works fine.

This is a good quality equipment, which has obvious potential for practical
use.For anyone contemplating the construction of an HF Transmitter
(particularly an ssb transmitter),buying this unit will save an enormous
amount of construction time.

We have taken into account that some recalibration work will be required to
get it onto the spot frequency,so we are offering it as a one -off bargain.
The price,which also includes the cost of packing and air freight to the
USA,is only $295 US Dollars.They do not come much cheaper than that!

If you would like more information,or wish to order,please contact Graham
Leo info@radio-exports.com
Thank you for you interest and attention.

Good thread fellers!

I fondly remember going to the surplus shops in the West End of London in the early 1960s.

I began traveling down there by train around 1963-65 where we used to find great shops like Z & I AERO SERVICES that sold surplus radios, components etc. This was truly a "Radio Row" on and around Tottenham Court Road. In that area today, there are numerous shops run by Asians (mostly from India) selling inferior quality consumer electronics products for bargain prices.

I will post all of these memories soon on my web page detailing where you can find all of the remaining Boatanchor emporiums today!

Tricky,

I can see that a manual is available for download from the
Boat Anchor Manual Archive:

http://bama.sbc.edu

and you should be able to get the tubes from Antique Electronic
Supply at

http://www.tubesandmore.com/

I had trouble accessing the manual from the browser interface
but had no trouble getting in with the direct FTP access. I may
be that my version of Netscape is just to old.

Expect the possibility that your receiver will need further
work, like capacitors replaced. The manual included a schematic.

Good luck with a nice old boatanchor.

I should have added - the low frequency response will be improved down to
frequencies about 1/4 of the previous values. The extreme high audio
frequency may be degraded but not very noticeable.

Hello:

I am interested in this exciter and have a few questions.

1. What is the maximum output level?

2. Is it all solid state?

3. Is an operation/maintenance manual available for it?

I believe it is normal for exciters to have 100 mw output. If that is the output (or more), and it is solid state and an instruction manual is available, I will purchase it for the asking price.

Thank you, Colin K7FM Portland, OR, USA

> Expect the possibility that your receiver will need further
> work, like capacitors replaced.

Not just a possibility, but a high probability. The work is not hard, though. Replace all of the old paper and electrolytic capacitors first. Don't waste money replacing all of the tubes at this point. They may be fine.

There is a detailed article about capacitor replacement at http://antiqueradio.org/recap.htm .

You should also clean the controls (volume control, bandswitch, etc.) with a spray cleaner such as DeOxit or Radio Shack tuner cleaner.

Those steps are enough to get many boatanchors back on the road. You can read about some of my boatanchor restorations at http://antiqueradio.org/radwrink.htm .

Have fun!

For the yet-to-be certified, an "ftp client" is simply a program that makes
it easier to download files from an FTP site. You can point and click
instead of typing in obscure commands. A decent ftp client for Windows is
WS_FTP by Ipswitch. You can download their "lite" edition from sites such as
http://www.shareware.com/ . Search for "WS_FTP LE" .

Stands for BRAND NEW CONNECTOR

follows ANC another new connector,

down through the series, a few samples:
DNC-- damn new connector
FNC---Friggin new connector
SNC--Shitty new connector
TNC--The new connector
UNC--un-needed new connector
VNC-- very new connector

etc

Ever look in a Newark Catalog at the connector section? How many connectors do we need?

A ham can never have too many connectors! Otherwise open circuits result
and although RF gotta go "some where", it doesn't particularly like
jumping gaps. But anticipating flames, I used to draw an arc almost an
inch long from an ART-13 transmitter with a pencil. On one occasion, a
newbie with a wet pencil ended up with a handful of splinters when it
exploded.
All in good fun.
Anyone have any spare Jones, Cinch, or a 3-prong type 71 Amphenol, or
maybe some Fahnstock clips??? And what's that goofy connector AEA put on
their TNC's -- had to special order that one.

Thanks to everyone I have a lot of input. Thats great, I don't often get out in these circles (Usegroups), but I think will do it more in the future.
From what I gather that bama (manual site) is down and out for now.Too bad! It would be a help.
I did replace a 4 part paper cap, cleaned contacts, and tested..finding tube ether bad or marginal. So its back to the wallet for more output.

Thanks all!

Tricky D

Gad, you're making me feel old! I used to haunt radio row on Cortlandt St. in NYC, along with nearby Chambers St.and Warren St., some 65+ years ago where I spent most of my nickels and dimes, occasionally a quarter, among the dozens of junque shops in the area for parts for my crystal sets and one tubers. I remember some of that expensive stuff, the guys wanted as much as $5 for some of the shinier things! Harrison Radio used to be in that area too, where my son picked up his first "commercial" xmitter, a second hand Heath Marauder.

I've since seen a lot of the places mentioned in this thread, plus many more, but nothing like radio row on Cortlandt St. before they planted that concrete jungle down there.

1094. Boatanchor Dxpedition Report

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-02-02 03:08:10 UTC
From: clemlaw@my-deja.com
Message-ID: <95d8amvga1@nnrp1.deja.com>
Source record: 56804

A few weeks ago, I posted a message asking for some help with a recently acquired Eico 753. Thanks to help on and off the NG, I got it running. One of the reasons I acquired this radio was that I was planning a trip to Venezuela, and wanted to bring *something* for HF with me. My Drake TR-3 is even bigger and bulkier, and I'm not sure it's even working (I haven't been on the air at home for quite some time), so that was out of the question.

I considered buying a solid state rig, but I decided against that for a couple of reasons. First of all, money was a bit tight, and I wasn't quite in the position to buy something very state of the art. Also, since I needed to ship whatever I got in my luggage, there was the risk of it getting lost or broken, and I figured that I wouldn't be out too much if something happened to the Eico.

After getting the rig running and burning it in at home with a temporary dipole, I decided that it was ready for the trip. The first step, obtaining a license, was extremely easy. Venezuela, along with a number of South American countries, recognizes the International Amateur Radio Permit, which is issued in the U.S. by the ARRL.

The next step was a bit more challenging, but not daunting: Getting the old rig to South America in one piece. I made a trip to the local thrift store, and purchased the largest suitcase I could find. It was a very ugly red plastic piece of luggage, and looked to be just about the right size for the 753. As a bonus, I also found a large sheet of foam rubber. The total cost was about $5.00. The rig and power supply fit nicely in the suitcase padded by the foam rubber, with just enough room to spare for the mike, key, and 40/20 dipole. The entire station weighed in at about 50 pounds.

As far as I know, most U.S. airlines allow checked baggage of up to 70 pounds. A call to the international carrier (Avianca) confirmed that they would also accept a 70 pound suitcase. (It is fortunate that I chose a suitcase to house the station. I didn't learn this until I was at the Miami airport, but Avianca would not accept boxes as checked luggage.) Undoubtedly, my red suitcase provoked a few cuss words in English and Spanish by the baggage handlers at Delta and Avianca (a piano mover once explained that the cuss words actually make it possible to lift heavier items than would otherwise be possible), and the Eico made it safely to Caracas. (One useful Spanish phrase that is not found in the phrase books but that I used with a number of taxi drivers and luggage handlers is "si, la maleta roja es muy pesosa!" ("Yes, the red suitcase is very heavy!)

The only damage to my rig from the long journey turned out to be that the plate cap on one of the finals had come off. My entire tool kit consisted of a small screwdriver, which proved more than adequate to make the repair.

I was in a hotel the first night. The good news was that I was on the fourth floor. The bad news, however, was that the windows were sealed. I was able to extend my dipoles to their full length insdie, but only by turning a number of sharp corners. Unfortunately, virtually all of the radiating portion of the antennas was well within the steel structure of the building. I was able to copy a number of stations, but didn't work a single QSO. Two stations (one W and one HK) seemed to copy portions of my call, but I was obviously not getting out very well. (The clincher was that the HK was about 40 dB over S9, but he still was obviously just barely copying me.)

The second and third nights, I stayed at a friend's apartment, which proved to be much more ideal. Directly across from my second-story window was a conveniently placed fence. I simply tied the center of the dipole to the ubiquitous bars on the window, dropped the wires down, and went outside and tied them to the fence. The Eico tuned up great on 40 and 20. There was even a nice dip when I tuned it up on 80 meters (what's SWR?), but I neither heard nor worked anyone there.

I could be wrong, but I believe that my antenna was facing to the north, and I expected better results into North America. As it turned out, I actually did better to Europe than I had expected. (One explanation might be that there are mountains directly to the North of Caracas.)

I got in two nights of operating. While I only worked about a dozen QSO's, I consider the dxpedition aspect of my trip a success. I wasn't out to work DXCC over the weekend, although I had enough success to show that something along those lines would clearly be possible on a later trip.

Nobody ever answered any of my CQ's. My most successful strategy was to wait until the tail end of QSO, and then call the strongest station. Also, there was an F contest going on the weekend of my visit, so I did work two F's and one FM who were calling CQ contest.

20 seemed to be dead both days (or maybe it was the Eico that was dead), and I only worked one QSO on 20 CW. Likewise, 40 SSB netted only one QSO, from a very patient Italian who finally copied my call after my repeating it a number of times. 40 CW proved the most productive, with QSOs with N4, F6, EC6, W2, VE2, and VP5. My biggest surprise was hearing and working another W operating /YV. A number of QSOs turned into ragchews, and I think a few stations were surprised to have a YV come back to them after they had worked a QSO.

I just wanted the thank those on the NG who provided advice on getting the Eico on the air, and let you know that I had a lot of fun with it.

73,
Rick W0IS, YV5/W0IS

Well, Matt, we obviously only need one connector series. Now, let's see,
that series would have to:

have constant impedance through 26GHz
need no tools to connect
be field servicable
handle about 5KW
be very low loss
be gold plated for reliability
be liquid-tight for reliability
safely operate at high altitude
be radiation hardened
be physically small
be cheap

You can't have that all in one unit. Each connector series is an attempt to
excel at one parameter, while not sacrificing too much elsewhere. For most
everyday needs, using commercial grade BNC, N and SMA series will suffice.
That's not too confusing.

Ed

1101. FS.RACAL Receiver Fine Tuner.

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-02-02 11:35:37 UTC
From: "radio-exports.com" <info@radio-exports.com>
Message-ID: <t7l6s5b9a5472d@corp.supernews.co.uk>
Source record: 56811

If you are the owner of a Racal Receiver (or indeed any other receiver) and you would like to improve the precision of your receiver tuning,then this Racal, Fine Tuning Indicator,Type MA1105 will undoubtedly be a great asset to your operation.
For PSK31 or other data modes,it's value would be inestimable.

It is a solid state unit,manufactured by Racal,which will display the receiver passband on a 104 LED bargraph display.
Two scales are instantly available for viewing the passband,either (-)500Hz -0-(+)500Hz or (-)1kHz-)-0- (+) 1kHz.

The precise position of the received signal is clearly shown by the LED's ,on a marked scale.The passband is scanned 10,000 times per second,to produce a continuous and very accurate display.
The Tuning Indicator is designed in appearance, to match Racal receivers.It is very compact,being the standard 19" wide by 1.75" high.

The unit can be used with almost any receiver (although designed as an accessory for Racal receivers).It will operate from three types of signal,viz; (1)audio input from the receiver,(appropriate bandwidth being selected on the receiver),
(2)from the receiver i.f. at 100kHz,or(3)from an i.f. of 1.4 mHz.

Power requirements are 120volts a.c. or 240 volts a.c.

This unit is in full working order and in "as new" condition.Data on the unit and schematics are included.

The price of this hard to find and very useful ,Racal Tuning Indicator,which includes packing and air freight to the USA,is just $295 US Dollars.
If you would like more information,or wish to order,please contact Graham Leo info@radio-exports.com
Thank you for your time and interest.

I grew up in Los Angeles. We were lucky to have many fine radio stores like Henry Radio, Figart's, Midway, and a raft of others. As you approached downtown on Venice Boulevard, there was a row of surplus stores topped by THE electronics war surplus store of all time "Sam's Surplus." Sam had gear in all conditions, from new in the box, to piles of gear in the back lot that had been dumped off a truck and exposed to the elements.

I bought my first ham receiver (an ARC-5) from Sam, picking it out of the pile in the back and paying about $2.00 for it. (Not including dynamoter.)

It was a thrill just to browse the store, and if I had a few dollars it was almost impossible to leave without spending it on some piece of black wrinkle gear. Those were the days.

>with me.

Rick,

Really enjoyed your story. I guess the closest to a dxpedition I ever went on was when we took a Gonset Communicator and a 6 volt battery up to the mountains of California. We made very few contacts at first, but then some kind gentlemen gave us details on making a 4 element yagi out of old coat-hangers. With this antenna we did MUCH better. That was back in 1956, but I still remember it vividly.

they are
heavy.

I am open to offers in the first instance but realistic preferred :)

Drake:
Drake R4B with 10m CW and 160m xtals
Drake TR4CW/RIT
Drake T4XC with 160m and 10m xtals
Drake T4XB with all of 10m and 160m xtals
Drake TR4
Drake RV 4
Two AC-4 supplies
MS-4

All of the above have been used over the past year or so and are all working
well, condition varies from good to very good. Some have original manuals,
some BAMA copies.

National:
HRO 50T1 with A, C, and D coils
HRO 60 coils A, B, C, and D
NC240D
NC300

Ten Tec:
Scout 555 with all band modules and noise blanker C/W mobile mount

Atlas:
210X with noise blanker mobile mount (80-10m SSB CW 100 watts out)

EF Johnson:
Viking Ranger II
Johnson electronic TR switch

Hammarlund:
HQ 170

I am in Suffolk and would prefer collection if possible.

I have for sale or possible trade the following ham equipment:
1) Midland model 13-505 two meter transceiver. This is a 12 channel crystal controlled, 25 watt rig. It is in very good condition with original manual.
$45.00 plus shipping

2) Realistic HTX 202 HT with battery, charger and battery pack.
$75.00 plus shipping

3) Bud 6 meter variable low pass filter model LF-601. If you are getting into TVs, this may be just what you need. Scratches and paint chips but real clean inside. $20.00 plus shipping.

4) Ten Tec PM-3 Power Mite QRP 40/20 meter transceiver with hard to find AC-5 tuner. Works good, knobs appear to be non original.
$115.00 plus shipping.

1115. Tempo One woes

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-02-02 22:36:31 UTC
From: sts <sts@ac.net>
Message-ID: <3A7B366F.4E4B5829@ac.net>
Source record: 56825

Hello to the group:

I have a late model Tempo One (Black face and cabinet) with S meter problems. The radio is clean as a pin inside and out and belongs to a friend. As one would say "mint".

Here is the problem:

On turn on the S meter will function normally for about 5 seconds and receive is good. Then the meter pegs to the right and receive goes out. I have replaced almost every component around the 12AU7 AGC amp to no avail. I say 12AU7, could be a 12AX7 as I am not in the shop to check. Anyway it is the correct tube as per the manual. I even swapped tubes and relays from a known working radio. No good.

The plate of the AGC amp should be around .2 volts and it goes up to -80 some volts as soon as the tube heats. Of course this shuts down the receiver completely. The grid and cathode are running around -108 volts which matches the radio I was comparing voltages with. I can "force" the plate down to -.2 volts with external resistance but that kills the AGC and the receiver swamps with strong signals. So, that won't do.

I have also checked the plate, screen and grid voltages on the IF amps and RF amp and they are ok except the grids too negative from the messed up AGC.

Anybody have this problem before? I would appreciate any help at all. This radio is too nice to "can"! By the way, the transmit is ok.

Please respond to: sts@ac.net

My News server is not too reliable lately.

My thanks to all in advance.

That sounds like my kind of dxpedition as well!

I was first licensed in 1973, and by the time I got my General ticket, there were quite a few Gonset Communicators and Benton Harbor Lunch Boxes on the market. Of course, they were such cool toys that I had quite a large collection of them. (At one point, I was the owner of a complete set of lunchboxes: Twoer, Sixer, Tener, and the identical model CB-1 11 meter rig).

Unfortunately, by that time, VHF AM was *almost* dead around these parts. I say "almost" because there was a small group hanging on with a six-meter AM net every night. A friend of mine about a block away also had a lunchbox, and I could tell when he turned on the receiver from the regeneration. When the net control's antenna blew down in a wind storm, VHF AM died for good in Minnesota.

Despite being about 20 years too late, I did once take a 6 meter lunchbox with me on a scout camping trip, though. (I had the matching 12 volt vibrator power supply). Of course, I didn't work anyone, seeing as AM was dead at that point! I did have high hopes, and the rushing sound of the receiver was soothing, I guess.

Hi randy...I have a T195B in like new condition on the inside, but it has normal wear and tear on the outside. It is complete and I doubt it has ever been used. I will trade for another interesting boatanchor or accept a reasonable offer. I have never powered it up, but it looks complete in every way. They guy I bought it from said he uncrated it. I have never offered it for sale before. It is very heavy and will cost a ton to ship. I live in Traverse City, MI 49686. Let me know! jack k8xx

I have a very nice Collins 75A-4 Receiver that I would like to trade or sell. It is CCA Very Good to Excellent condition. SN 1251, 4:1 reduction knob, standard 3.1 kc filter. The receiver works great and is very clean. There are a few white spots on the top of the cabinet lid, from where the speaker feet sat. I have not tried to clean these off, but I suspect they should be able to be removed. I've enjoyed the radio, but I'm ready to play with something new.

See the 75A-4 here:
http://www.mindspring.com/~ekugrad/images/75A-4.JPG

I am interested in trading this receiver for any of the following radios:

Yaesu: FT-1000MP (will add cash), FT-990 (AC with filters & mic)
Kenwood: TS-950SD, TS-850Sat (with filters & PS-52, SP-31, & MC-60), TS-940 (late SN with filters & speaker)
Icom: 765,
Collins: KWM-2A (RE, late production with 516F-2 WE or RE), S-Line
Drake: C-LIne (late SN's with Sherwood mods on R-4C and all filters)
I will consider other trade offers.

I prefer to trade the radio, but If I don't get any takers on a trade, I'll sell the radio for $1250 shipped and insured in the lower 48.

Thanks & 73
David W4IDX

1133. Transformer info?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-02-03 09:36:27 UTC
From: SkrewBall <ptaylor@qwest.net>
Message-ID: <3A7BD11B.97A702BD@qwest.net>
Source record: 56843

Hello..

I just picked up,what I assume is a power transformer, have copied down the layout of it,the best I can with an ohm meter,and am wondering if anybody has any info on it,or could kindly look it up in an old manual,or catalog,if they have one..
I remember having bookmarked a page that had transformer manufacturer info,if you looked it up by the numbers on teh endbell..
But I seem to have lost it? could anybody send me a link to that aswell? (I'm a pest,I know!)

Anyways..The numbers on it are:

19C3O7137 (don't know if that's a zero 0 or a letter O?)
-1
352925

Its a pretty decent size, I would guess about 6 inches endbell to endbell,and maybe 5 1/2 tall?
It has 6 leads coming out of one end,and 8 out of the other.
Any ideas,or help would be MUCH appreciated!

get a filament transformer and connect the low voltage output to a high
resistance pair on the transformer you need to identify..
that way you'll get a good idea of the ratios and with a little math
identify the primary , etc..
this way is a lot safer than using 110volts direct..
good luck

General Electric mobile radio transformer from the 25th week of 1969 or 79.
Made by EIA ID mfr 352. Find an old
GE parts catalog. I don't have any anymore, and my EIA/TIA book seems to
have grown legs also. Might be a MASTR Pro base station power transformer.

I assume it once worked correctly...

Not being familiar with the AGC circuit, I'll have to assume a few things. Uusually, the AGC circuit receives negative bias from the RF gain control (unless the RF gain control is connected to the cathode circuits of the IF amp). Check to see if this is the case. A shorted crapacitor may be feeding -80V directcly into the AGC circuit from the RF gain circuit.

Another possibility is to look at the diodes that rectumfry the IF signal to provide the AGV voltage. If shorted/leaky/open, it'll mess this circuit up.

One clue is that the RX works briefly. What may be happening is yuou have a gassy tube somewhere in the IF that is creating its own bias as it warms up and then swamps the AGC bias with its own. Yoink the IF tubes one by one to see if the AGC voltage remains where it oughta (with one of the IF tubes missing it should be 0V or very slightly negative. Also check voltages as it warms up to see if you can find out where this mysterious -80V bias is coming from.

AGC circuit problems are some of the most difficult to troubleshoot, and figure out. Good luck and 73 John

1144. Re: Transformer info?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-02-03 16:59:50 UTC
From: dbowey@aol.com
Message-ID: <20010203115950.21065.00000518@ng-mh1.aol.com>
Source record: 56753

>Any ideas,or help would be MUCH appreciated!

There is a color code for power transformers. If the leads are colored, what are they?

Don

1146. 2001 Winter CX Contest

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-02-03 17:13:38 UTC
From: Mark Bell <bell@blazenet.net>
Message-ID: <t7of7ack3qml7e@corp.supernews.com>
Source record: 56755

Hi Gang --

I've not seen a post for this contest, but thought y'all might be
interested....

This info is from the Classic Radio Exchange Newsletter - Winter 2001, put
out
by Allan Stephens N5AIT:

The Winter 2001 Classic Radio Exchange ("CX") runs from 2000 UTC Feb 4
to 0500 UTC Feb 5 2001 (3PM EST to Midnight EST Sun Feb 4...).

Exhange your name, RST, QTH (state, province, DX country etc) receiver and
transmitter type (HB send Final amp tube or transistor).

The same station may be worked with different equipment combinations on each
band
and on each mode.

Call "CQ CX" on CW, and "CQ Classic Exchange" on phone.

Suggested frequencies:

CW: 3.545, 7.045, 14.045, 21.135, 28.180

Novice/Tech Plus: 3.695, 7.120, 21.135, 28.180

Phone: 3.880, 7.290, 14.280, 21.380, 28.320
New AM freqs: 14.286, above 21.4, 29.080

Scoring: Multiply total QSO's (all bands) by total number of different
receivers plus
transmitters (xcvr counts as both xmtr and rcvr) plus
states/provinces/countries worked
on each band and mode.

Multiply that total by your CX multiplier, the total years old of ALL
receivers and transmitters
used, three QSO's minimum per unit. For transceiver, multiply age by two.
If equipment
is HB, count it as a minimum of 25 years old unless actual construction date
or date of
its construction article is older.

In other words: Score = A x B x C where
A = Total QSO's all bands
B = RCVRs + XMTRs + states/provinces/countires (total each band and
mode

seperately; add totals together) worked
C = CX multiplier.

Send logs, comments, anecdotes, pictures etc to Allan Stephens, 106
Bobolink Dr.,
Richmond, KY 40475. Include two-ounce SASE for next newsletter.

email reports may be sent to Allan.Stephens@eku.edu.

As I said, I don't know if Al posted to this NG, so sorry for the repost if
he did.

See ya'll there.

Message-ID: <95hh2v$d0n$1@uranium.btinternet.com>
Source record: 56759

Apply a very low 50Hz voltage to one winding and measure what voltage you
get from the other windings. In a couple of minutes you will have a complete
circuit and turns ratios.

You should be able to recognise the primary winding.

Estimate power handling capacity by comparing its bulk with another
transformer of known capacity.

Estimate the various load current capacities by measuring DC resistance of
each of the windings. Sum of watts available from each winding, plus a bit,
should equal total wattage rating.

****
Regards, Reg, G4FGQ

I have a very nice SX-73 (R-274). Its only defect is that the tuning knob is OK but not original and the dial-lock is missing. All else; panel, knobs, et al are excellent. Currently (no pun!) plugged in and in regular use. I'm looking for a nice, fully functional ART-13/ATC with appropriate power supply. May also consider other Mil AM rig.
Thanks,
de Jeep/K3HVG.
Please note, the above receiver is not for sale.

From: SkrewBall <ptaylor@qwest.net>
Message-ID: <3A7C8F9A.DC677AFD@qwest.net>
Source record: 56769

Lets see..

there are two large black leads (presumably the primary?) (winding A)
one winding has a green,tan (ct) and green and white lead (winding B)
another has red,orange (ct) and red and white lead (this winding seems to be
antiphase/bifilar wound) (winding C)
on the other side of the tranny there are two windings
one has a white wire,and i can't tell the color of the other two (the entire
tranny is coated in that epoxy stuff,and they seem to have coated these two wires
as well,they are maybe only 2 inches long) call these 2 (ct) and 3 (winding D)
The other winding has blue,black and white(ct),and blue,with a dab of red paint
on the end (winding E)

With 10 volts applied to winding A (6.5 ohm DCR)
There were the following voltages on the other windings..

Winding B 28.8V (17.5 ohm total,9.3 and 10.7)
Winding C 1.3V across the entire winding 20,and 21 volts center tapped (14,and
13ohms DCR)
Winding D (this one confused me?) I think i may have marked it down wrong..(7.3
ohm DCR and 9.3 ohms DCR) 4.3V total (2.1 each)
Winding E 6.6V 3.2 each half (8.9 DCR and 9.3 DCR)

Does any of this help? :-) Patrick..

Hmm..
According to this list it was made by Magnetic Windings Co./Essex
http://www.triodeel.com/eiacode.htm
But the list is "incomplete" and rather old,this transformer seems to be a bit
newer anyways?

Hello and thanks

I am looking for transistor data for a TRW PT4236c
it is in the RF power amp stage of a 70Mhz PMR radio
and I am looking to cannibalise the PA strip to use on 50Mhz
(6m Amateur Band).
Can any one point me to a URL with the data or have you got
a data sheet.

Thanks Martin

General Electric mobile radio power supply 4EP38A10. 1969. Blk = input,
Brn= centertapped 18V supply, blue=CT 45V bias supply, orange to red =
approx 300 volt tapped at 250 (R-W). Green to Green White another 300 volt,
tapped at white. These two windings usually connect to two bridges and are
stacked for 600 Volts for a 5894. You need a copy of schematic 19D402421
from your local friendly GE mobile radio repair station. Oops, long gone.
My copy is available for $500.00.

When we finally make it into communion with ALL
our fellow men (rather than subjecting them to "Humanitarian
Bombing" or manufacturing and selling Land Mines), then
we'll be part of a universal currency that values the hourly
labour in Chinese sweatshops at the same value as our own.

However, we won't then "Spend A Penny", but we'll "Euronate".

> okay, and 3A average - again OK at 1kW with an SSB or CW duty cycle.

I think that the power rating for an 'N' connector - the real
version of the BNC - is 50W, i.e. 1A. The inner conductor of
URM76 = 7/0076 or similar, which has an open-air rating of 2A,
I think the current rating of URM76 is 1A.

When I used to play with real power on VHF/UHF, I used 'C' type
connectors. Professionally EIA type connectors would be used on
1kW relays, certain 250W VHF/UHF ATC transmitters used 'C' type.

With a poor match (which the transmitters would tolerate quite
well) it was quite easy to cook the connectors, unsoldering the
inner conductor quite efficiently at a current node.

(For those who do not know, the 'C' type is similar to a large
sized BNC, the centre pin is about 3mm dia)

1191. Correction to ad in ARC for CC-AWA's Spring Meet

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-02-04 14:56:40 UTC
From: Ron in NC <kc4yoy@pop.trellis.net>
Message-ID: <01c08eba$ec49e1a0$2e4c96d0@ron>
Source record: 56701

I was just notified by a very observant person that
there is a mistake in the ad for the "Spring Meet"
on page 25 of the current, February 2001 issue of
Antique Radio Classified.

There is a line of text just below the schedule that says,

"There will be NO buying, selling trading, or displaying
of merchandise before 8AM Saturday"

SATURDAY SHOULD BE FIRDAY ! ! ! !

I can't believe I made a stupid mistake like that.

It should read,

"There will be NO buying, selling, trading or displaying
of merchandise before 8AM FRIDAY".

This is the same schedule that we've had for a number
of years now.

I'm sorry for the confusion.

73,

Ron

I need anything prior to 1965 with a few exceptions as well as the following:

1966 - Mar, Apr.
1976 - Jan.
1979 - Jan.
1984 - Jan.

I have these extra QST issues to trade:

1966 - Oct(2)
1967 - Full year (will trade for full year that I need).
1968 - Full year (trade only), plus Apr, Oct.
1970 - Dec.
1971 - Full year (trade only), plus Mar, Apr.
1972 - Jul, Aug, Sep, Oct, Nov, Dec.
1973 - Jan, Feb, Mar, Apr, Jun, Jul, Aug, Sep, Nov, Dec.
1974 - Jan(2), Feb(2), Mar(2), Apr(2), May, Aug, Sep, Oct, Nov, Dec.

Can you help?

1210. Chicago Transformer (Modulation)

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-02-04 23:21:27 UTC
From: TCNET058@ysub.ysu.edu
Message-ID: <40B10227S86.TCNET058@ysub.ysu.edu>
Source record: 56720

I friend gave me a Chicago Transformer Modulation transformer that
I was wondering if I could dig up some information on.
Its a No. 677-0380-00 Class 1A

There is some printing on the side of it that gives the frequency
response (200-15000 +-1db) and also the pin-outs on the bottom posts.
It says the test voltage is 3000 and one of the secondarys is 2400
ohms at 350madc.

If anyone can steer me to a web site that list Chicago Transformer
modulation transformers, or has information on what power levels/tubes
could be used with this thing, I would greatly appreciate it.

Thanks and 73s,

-Fred Sole

AC/DC powered desktop/portable unit, operates up to 160 mhz with the included optional Tempo Digital 160 Frequency Convertor. Has 5 small Nixie(?) tubes for the display, looks like new and works great. Made for Tempo (Henry Radio) by Takeda Riken Co of Japan. 6.5" W, 3.5" H, 8" D with tilting bail handle. Color is a very dark gray or black. Sorry, No manual. I have never seen another one of these counters, works great but sold as is. I will deliver conus for $69, email direct if interested, thanks for reading.

Hello--
In the greater Boston area, I recall John Meshna, Jr.'s surplus emporium in Lynn (not far from the Coca-Cola bottling plant), Eli Heffron & Sons in Cambridge, and the radio shops I just missed by a couplee of years in Corn Hill section of Boston (which were paved over into Government Center by 1961 or thereabouts).

We also had Lafayette Radio, the original(?) Radio Shack (and its Commonwealth Avenue store), a couple of Olseon Electronics outlets, and some great wholesale/service supply outlets that would occasionally offer surplus goodies.

This is a 10MHZ to 4GHZ Spectrum Analyzer Plugin.
Serial Number 713. A copy of the instruction manual
is included.

This unit cosmetically is about an 8+ out of 10. It
is in working order but has not been calibrated in a
long time. I recently powered it up using a TEK 556
and it was able to display a sweep of the noise floor
plus any signals I injected (mostly HF 10 - 30 MHZ).

If you are interested, make me an offer.

I understand that Agilent has been doing that with spectrum analyzers that they got through a nice trade-in rebate if you bought a new analyzer. They don't want potential SA customers buying old stuff, when they could be "guided" into buying new from Agilent. Agilent sure isn't the old HP.

Hello Again!

With some help from a friendly guy here,I got some info on the
transformer I picked up,and have found that it is from
a MASTR Pro repeater?
If anybody has a schematic of this,I would like to take a peek at it,if
possible.I really just need the power supply info..

I am planning on building a tube amplifier for my home stereo,and was
hopeing that this would be suitable.

Thanks! Patrick..

1233. FS.RACAL RA1772 Communications Receiver.

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-02-05 13:03:19 UTC
From: "radio-exports.com" <info@radio-exports.com>
Message-ID: <t7t94iae9k6h01@corp.supernews.co.uk>
Source record: 56743

We have just taken into stock an extremely good example of this Racal made,high grade, solid state communications receiver.

Frequency coverage is 15kHz to 30 MHz and is continuously tunable in either 10Hz (Standard Tune) or 100Hz (Fast Tune) steps.
Coverage is in switched bands,1MHz wide,(with overspill of 20kHz at each end).Standard filters are fitted for .3,1.2,3.0 & 13kHz bandwidths).A switched panel meter indicates: r.f.out,l.s.b.,u.s.b.,various voltage tests within the set,and f.s.k.,output.

Condition is extremely good.The front panel is unmarked.All switches and controls are original and unchipped.The receiver has been tested and is in full working order.

We have no cabinet or handbook for this top quality receiver,which is designed for mounting in a standard 19" rack,and this is reflected in the very competative price.
As a "one-off" opportunity,we will: Pack for shipment and Air Freight this fine receiver to the USA ,for a total cost of just $1185 U.S.Dollars.

If you would like more information or wish to order,please contact Graham Leo info@radio-exports.com

Thank you for your kind interest and attention.

Did any denizens of this NG, aside from myself, participate in this contest?

I had both my HT-32 Mk 1 / SX101A and HT-37/SX-111 combos on the air.

Remember to send your logs in, however paltry they may be. For the Fall
2000
contest, we had a lot of people in the contest, but only about 15 or so
actually
sent logs in!!

1238. Conked-out TV-7D/U -- any ideas?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-02-05 18:30:48 UTC
From: Mike Silva <mjsilva@my-deja.com>
Message-ID: <95mrgp$83s$1@nnrp1.deja.com>
Source record: 56648

My TV-7D/U started acting wierd over the weekend and finally quit. I noticed that suddenly I couldn't do a line adjust (what had been correct an hour before was now down to about 40). Turned if off then back on an hour later and it was OK for a while, then the same thing happened, and now the line adjust does nothing (0 reading). Does this ring a bell for anybody? I don't have any service info for the tester -- is any available on the web? Thanks.

73,
Mike, KK6GM

That is the way my TV-7D/U acted before the meter finally crapped out for good. Open up your TV-7 and disconnect one side of meter. Measure the meter resistance, it should be 2365 ohms. If not, the meter is starting to open up if it is not open already. If the meter is the problem, you can replace it with a Digital Panel Meter. I published an article a couple of years ago on how to do this. Anyone interested in a copy of that article can E-mail me and I will E-mail back a copy to you.

Very nice receivers. My 388 works very well. The end points of my PTO have drifted a bit (5 KHz off at one end and no way to adjust except replace the PTO) but the radio has very good sensitivity and 'hears' just about anything my newer rigs can.

1251. When you get rich...buy my RACAL RA-153

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-02-05 22:13:16 UTC
From: radiomatt@aol.com
Message-ID: <20010205171316.20813.00000594@ng-xa1.aol.com>
Source record: 56661

Well, it (another posting on this newsgroup) says he can make you rich beyond your dreams. If he's right, you're going to indulge your craving for a good hollow-state radio, right?. Well, have I got a deal for you!

Let me propose my Racal RA-153. A big radio with the legendary Racal Barlow-Wadley phase-locked loop tuning (960 kHz-30+MHz). But unlike it's sister, the RA-17, this has two complete IF strips (100kHz) for RDF functions. And being for RDF, the phasing is very closely matched.
Comes with the original manual, beat up but apparently complete. Pickup ony on Long Island, or pay through the nose for packing and shipping. The radio is in good shape.
Want $625 + shipping/crating.
Extra power supply for $!00 more.

See it in Fred Osterman's book.

Tubes fail for 2 reasons. One is that the thoriated heater runs out of thorium ions After all nothinglasts forever! The supply of Thoriated materialis finally depleted.
A better reason is that the vacuum is not perfect.
A perfect vacuum is hard to keep!
The tube is made with an additioal. non electronic,tab within the bulb called the "getter"
The Getter tries to swallow all the stuff that the getter couldn't clean up.
It Gets" all the unwanted gasses , even if it is in an evacuated bulb.
Finally the Real reason is that "Mother Nature is a bitch! With Apologies to M. Nature. David from roseland.

Ahh, Meshna! In Lynn, or was it Lynnfield? Still have stuff I bought there. And then there was the Radio Shack on Central Ave in Newark, NJ 70 years ago. No connection with the RS of today as far as I know. I still have a gridleak I bought there. You all know what that is I'm sure.

Sounds like an old electrolytic capacitor to me.

Dan Nelson repairs these. His email is:

Daniel J. Nelson
djn@ieee.org

The following web site has info on the TV-7:

http://www.geocities.com/SiliconValley/6992/tv7.htm

Good luck!

Open it up and check the 83 rectifier tube inside it. More than likely it is either this, and/or the fuse bulb has given up. Same thing happened with one of mine awhile back.

A John R. Leary SP-600 for sale, has a black wrinkle finish front panel, totally re-capped. has a product detector, separate if gain control, seleectable 4-8 or 16 ohm audio output. Too many modifications to list. Works great! I will not ship, pick-up only in the Gulfport,MS. area. Has a long list of modifications in the owners manual, along with drawings/schematics.

More on the John R. Leary custom Re-Engineered SP-600's in the May 2000 issue of Electric Radio No. 133.

Approximately 40 of these fine receivers were built.

Why am I selling it? because i have too many SP-600's.....

Price......Exactly what i paid for it, $505.00.....No bargaining.

>

Scott,

I have both the 200V and 100V and there just is not that much difference between the two. The 200V is a bit harder to find since only about 500 were made compaired to the 100V where about 1500 were made. They both function just about the same. The main reason the 200V was made was to reduce production cost at CE.

I have a photo of them both at my web site below, where I operate them side by side. Good luck on your hunt for one and jump on a 100V if you get the chance.

About the Chicago Transformer I posted recently. It turns out, after reading the printing carefully, its not a "Chicago Transformer Co." after all. It was made by the Chicago Transformer Division of the Essex wire company, Zanesville Ohio.

Which makes this modulation transformer a real odd-ball. Probably why its been handed down from several owners!

I remember going to a Place called Bond Radio in Waterbury, Ct. I was 9-10 yrs old in 1970. My Dad(non-ham) went there to get crystals for his wonderful
Regency scanner. Still don't know if it was a ham shop or a glorified 2way shop
with an impressive showroom of antennas and gadgets.
I left CT in 1977, and learned that the store was absorbed by Hatry Electronics,
another place I barely remember visiting.
Anyway, it was one of the several wonders of my childhood that helped pave the
way for my future. A romance of sorts, difficult to explain.
Nevertheless, glad
I had the privelige to experience it.

From: randy_radio@my-deja.com
Message-ID: <95nsho$6mt$1@nnrp1.deja.com>
Source record: 56686

Hello. I have two marine radios here, one the INTEC that I am trying to get on HAM bands and the SEA 112 that came along for the ride. Neither unit will go into xmit when the PTT is pushed on the mike. The mikes PTT line on the INTEC terminates on a Molex connector. To what pins on the Molex do I need to jumper together? Also is there a jumper on the antenna coupler jack needed to enable the xmiter? I do not have the antenna couplers for either unit. I also need the programming info for the INTEC. It uses a diode matrix for the synth. and it has 3!!! xtal ovens in it plus a Collins mechanical filter. I would like to get this radio on 80 and 40
meters.

Thank you,
Randy KB8ASO

p.s. Where would I get the EPROMS on the SEA programmed if I decided to do so?

1281. Valiant VFO Help Needed

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-02-06 05:03:54 UTC
From: Bob Maser <w6tr@mindspring.com>
Message-ID: <95o0naddq1@slb2.atl.mindspring.net>
Source record: 56691

I just bought another Valiant I and it is in great shape but the VFO has problems, no oscillation on 75 or 160 as evidenced by no grid drive. It shows good grid drive on the other bands but the oscillator note sounds more like a buzz than a note. When I use a crystal it works fine. I am looking for the alignment part of the assy manual that goes into detail on how to set up the VFO. Any help?

Thanks, Bob W6TR

Long gone, calling and E mailing Kenwood was the first thing I did.
I dont understand how someone could be entrusted to sell clean estate stuff
then be a total slob.
The seller threw it and a Heathkit in a box of transformers, meters and
heavy Motorola crap (uncovered) to ride several hundred miles to a hamfest.
His explanation between choking on a cigarette was "its just a couple
scratches"
.....Your making a big deal about nothing !
"Most people usually dont mind, sorry I couldn't sell it"
"I am Sorry OK !..... I will buy it, hows $150 ?

.....I cant post the reply given him.
I believe the SOB pig switched panels with an older set, but cant prove it.
Now AM Receive is dead !

I'd be very surprised. They don't support any of their older rigs, I believe the earliest is the TS850.

You can send an email to Terry at tandt@townsqr.com. I swapped him 430 parts rig some time back and he may make a faceplate available if he still has it.

Dick

From: COL

Can someone tell me what cathode poisonning is , it seems to happen when a tube is stored for say 40 or 50 year,

Before use , one hase to let it "glow" for at least 24 hours before actual use?

greetings

dick

contest?

I was on 40 CW for a bit. Lots of activity around 7046. My time was
very limited, but I did work 5 stations. Great to hear so many old
glowboxes sounding so good. Actually had a "run" going for a bit -
folks were calling me as soon as I finished a QSO!

Rig here was my homebrew hollowstate CW transceiver made
from "recycled" BA parts. Pair of 807s in the final, 100 W out. 866As
in the power supply sure look purty in a darkened basement shack.

(See Electric Radio for July, 1995)

I remember PolyPaks, especially my last order of December 12, 1982.
In early 1983 I got a letter from the lawyers handling PPs bankruptcy.
I filed a claim and eventually got a bit of my money back.

But I'm not bitter.

PP had a tiny retail store in Wakefield.

Meshna had better stuff.

Reed,

Go to http://www.shlrc.mq.edu.au/~robinson/museum/command.html
It's a great site for info on the Command receivers and it does contain
the BC-454 schematic. I found this page thru the ARC-5 webpage at
http://www.arc5.com/duck/ which also contains links to other related
pages.

Yes it does, but not one that is good enough to see parts values however.

Some great pictures at both those sites. Lots of work went into them.
Unfortunately, not able to read parts values.

Many thanks for the reply. Have book marked them for future trips
back to them.

Both excellent sites, and are now book marked here for future viewing. The alignment section is just what I needed. Finally found my "Command Sets" book that has been missing for awhile. It has a great schematic in it. So, now armed with that and the web sites you mentioned, I am off to the repair bench.

Many thanks

I have a couple of BOats that I wouldn't mind putting on 30 Meter,
would it be hard to make one of the old Heathkit, or HT-40 Transmitters
work on 30 meter?

Also can I use small modern crystals in these old rigs, I could make an
adapter to plug them in, but will they work?

Danks,
Jim - KU4QW

Jim,
Your best bet to put a BA on any of the WARC bands is to use a Collins S/Line. They're broadbanded enough to go anywhere except from 5-6 MHZ. I hear pleanty of them on the air on 17M with my KWM-2-A I converted for same. All you need is the correct crystal and it's a plug and play installation.
As far as the rigs you mentioned it's a crap shoot. Maybe they will or maybe they won't. More than likely maybe they won't.
Hope this helps.

1342. 30 Meter & Which Crystal - Do IT !!!!

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-02-09 07:27:22 UTC
From: Bis Wichy <wd0hco@ev1.net>
Message-ID: <3a839c5f_1@newsa.ev1.net>
Source record: 56552

Collins ISN'T the answer for everything... Jeeeeese!

Old simple non-VFO AM-CW transmitters are VERY easy to take to 30. It's very easy to do but you will have to give up on 40 meters (or replace the band switch entirely).

To bring up 30 meters in the 40 meter bandswitch position:

First attach a 50 ohm dummy load -> PLEAZZZZ don't do this over the air!!!

Now find a 30 meter XTAL - if you don't have one - feed a signal generator tuned to 30 meters thru the XTAL socket.

Next step is to work on the PI net in the final amp (a 6DQ5 in the case of a Halli HT-40). Simply move the final tank coil tap to a spot between the 40 meter and 20 meter taps.

Now turn the ANT control to min capacity (ALL PLATES OUT) Min antenna coupling.

Next, quickly key up the transmitter and adjust the (grid) DRIVE control for MAX grid current.

Key the transmitter quickly while turning the TUNE control. You should see a small dip near the center but not a lot of RF power. That's OK. You are looking for the dip (resonance point) for now.

Now locate the 40 meter coil form used in the Oscillator circuit. (a 6CX8 in Pierce config in the HT-40) Again key the transmitter while you screw the coil slug up. You will see power slowly coming up as you turn the slug. Max power will be when the slug is at very top or even removed from the coil form.

Now key up the transmitter and adjust all controls normally and you should see around 30-35 watts.

AT NO POINT SHOULD YOU EVER KEY THE TRANSMITTER FOR LONGER THAN 20 SECONDS.

That 6DQ5a is not very forgiving!!!

As for the XTAL adapter - it works and I made a bunch. Go to my web site and click "XTAL Package change" for a description on how to build them with pictures!

http://www.megacycles.com

Be warned - Some hetrodyne type AM transmitters are harder to put on 30. Same with the older phasing type SSB rigs. They require a new XTAL (for the upconverter) and of course the VFO dial re-done. Back in the 70's I placed

several Viking Couriers and Rangers in aaaaaaaaaah "broadcast" service on bands farrrr removed from Amateur bands.

WDï¿½HCO

Relax folks! It wasn't in this country and was legal in the country I did it at. (They were more than happy to have a radio station).

I have an RF "can" from a military radio which I would like to identify
so I can use it for trading.

Take a look at:

http://novatech-instr.com/Ebay_Images/rfcan1.jpg
and
http://novatech-instr.com/Ebay_Images/rfcan2.jpg

Tell me if you recognize it. This is not a "for sale" item.

Some information:

4 adjustable caps. The cover plate slides to give access
4 adjustable coils, opposited side from caps
Grid cap on top.
Hole for pass through selector shaft.
5 ceramic pass through solder terminals on the back.

Thanks.

Steve.

South Normanton & District Amateur Radio Club,
in association with the G-QRP Club, are holding what
promises to be the year's main amateur radio event
in this area.
"Junction 28 QRP Convention", will be held on Saturday
17th March 2001, at the Village Hall Community Centre.
Market Street, South Normanton, near Alfreton in Derbyshire.
Located just 5 minutes from Junction 28 of the M1 motorway
and the A38, this will be a traditional radio event, organised
in the true spirit of amateur radio.
All under cover, there will be a good variety of stallholders
with components, kits, vintage and radio surplus, plus the
G-QRP Club stand, club stands and special interest groups.
There is a programme of lectures by Rev.george Dobbs G3RJV,
Rob Mannion G3XFD (Editor of Practical Wireless), Tex Swann
G1TEX (Also from Practical Wireless) and Douglas Pitt of the
Narrow Bandwidth TV Association (NBTVA) who will giving a talk
and live demonstration of mechanical television.
Hot and cold food and drinks will be available, plus a licensed bar.
Talk-in will be provided by GB0LOW on S22.
Doors open 10.00am.Admission is just ?1.00. FREE PRIZE DRAW.
Further details from the organiser on 01623 465443.
We look forward to seeing you there!

Looks all they are the cans from the RBS and RBM Navy receivers. Four bands, each stage in its own shielded box with the bandswitch running through each.

ICOM IC-O2AT handheld in excellent condition. Late SN..Comes with a drop in type battery but no drop in charger. Battery is rechargeable with a cigarette lighter plug in cable which also operates the radio.The radio also includes all of my original shop and factory info on the O2AT series as well as a manual. The receiver has been opened up to receive the WX channels. My experience with ICOM covered 17 years in Dallas.
$125 Fred 940-321-2029 fred-palmer@msn.com

1367. Re: Two R-390s FS

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-02-10 01:24:57 UTC
From: radiomatt@aol.com
Message-ID: <20010209202457.27455.00000260@ng-df1.aol.com>
Source record: 56577

>Can you tell me the difference between the R-390 and the R-390A?

The original R-390 was designed by Collins as a cost-is-no-object radio. About 15,000 were made, either by Collins or Motorola.

The government figured somehow the cost could be reduced, so they designed the A version.
It cut out 8 tubes, and replaced some of the filtering with mechanical filters. But now the A vesion had one less RF amp, and three or four fewer IF stages. 24 tubes instead of 32.
But instead of three tuned circuits in the front end, only one and the 6 IF stages, reduced to 3. I believe the 390 is less susceptible to overload from nearby stations off freq.
Sure, the gain is still there, but everything runs near maximum ratings on gain, so (to me) the A sounds as if it might be unstable (too much gain in each stage), which is compounded by the "pinging" of the mechanical filters.
Interestingly, when it was decided to modify the R-390A for direction finding use (very exacting standards), they went back to the IF stages of the R390!
Each is a good* radio, but the A is the cheapie version, though the last production run cost the government over $ 40,000 per radio!

*Oops!.... Superb radio

Dear folks;
I've discovered that LEDTronics has replacements for
filament bulbs. they use LEDs but have bases which fit the sockets for
flange, bayonet, and screw type bulbs. I'm thinking of ordering
replacements for my 9mm bayonet bulbs in my vintage radios. If any of you
want to do the same, please check out http://www.ledtronics.com for more
information. By the way, these LED lights are bright and are designed to
be direct replacements. They also come in a rainbow of colours plus
white. As far as I know, they create no QRM and last 100,000 hours.
Yours,

Bruce Atchison, electronic musician, writer, Jesus freak, and rabbit fan.

Bill,

There is one real, old fashioned radio store in the Vegas area. It is Radio World in Boulder City down by the Hoover Dam and is owned by Dave Floyd who is both a ham and an electrical engineer with a real love for radios. He always has some tube gear and as well as other used rigs and lots of used test equipment. He also sells commercial VHF/UHF radios and marine radios (it is "The Best Radio by a Dam Site" after all). It is a great store where you will always find a welcome. Highly recommended! I love to drive down just to see what is new and say hi to Dave.

To get there you drive down US-95/I-515 to Boulder City, as you enter Boulder you will see a strip mall on the left (north side), Radio World is about two thirds of the way down the store fronts. You will also notice a yellow delivery truck parked out near the highway with "Radio World" on the side and there are several antennas up on the roof of the strip mall.

The address and phone number is:

1656 Nevada Highway
Boulder City, Nevada 89005
702 294-2666 Phone
702 294-2668 Fax

Radio World's Web Page and Dave's E-mail are:
http://www.radio-nv.com/
radio@anv.net

Hope that you enjoy Vegas and especially Radio World. Spend lots of money and keep my taxes low! The governer takes something like 6 or 7% of all the take on The Strip. I'm kidding, but as you look at The Strip remember somebody is paying for all those lights! Ask yourself if you want to contribute. One way or the other I hope you have a good trip.

73, Rob, KD7HRN

Al,

Couldn't agree more. Radio World is a gem in an otherwise electronic hobbiest's wasteland. The local Vegas electronics part's store has been out of 0.01 uf 630vdc capacitors for at least two years, spot is still on the wall for them though! Before I got back to my electronics roots we had a real surplus store, out of business now so I continue to kick myself for not shopping when they were still open.

From: xtaltest@my-deja.com
Message-ID: <962g8maob1@nnrp1.deja.com>
Source record: 56592

HI guys, question. I just came to own two old National Ham receivers. One is a 3 tube model SW-3 and the other is a 7 tube model FXB. Both are in good conditional internally and both have National type 5880 power supplies. I also have a bunch of plug-in coils for both radios. I don't know much about Ham equipment, I mostly fix-up and collect old crystal sets, and broadcast radios from the 1920s and 1930s. Sets made by Atwater Kent, RCA Radioa and Philco. My question is are these radios worth my time and effort to fix them electrically and and physically. Both radios look good inside but the outside paint is in sad shape with some surface rust. The power supplies have a little more rust. I don't restore radios to sell, I just like to fix-up and collect the radios that are worth restoring and preserving for the future. Thanks, Charlie

Several people have suggested Navy RB* radios. This thing has a grid cap
and the Navy Radios have single ended tubes. The Bendix MN-26 was also
suggested-- still looking for pictures/docs on that to check. Stamped
in the aluminum is a small square with SC in it (in the C22 adjust hole).
I think that means "Signal Corps."

Thanks for looking. I am still curious.

Having some pieces from and old RBM-4 lying around, they sure look almost identical. The only difference being the orientation of the coils. The pass through for the selector - Is the hole in the wafer flat? The shaft was flat on these. There were four of these cans ganged together and directly under the chassis and the large tuning air variable.

I got a little surprised when I saw the Used Price for a Collins 51S-1
on http://www.dxing.com/rx/51j4.htm listed as $1100-2100.
Is that a realistic price ? Because it is a collectors item ?
Or is there a 0 too many so it should be $100-210 ?

Any advise is welcome

These are both desireable and collectable radios. If you don't want
to restore them you can easily sell them to someone who does.
If you are interested in any trades I have several old broadcast
radios and consoles from the 20's through the 40's.
Where are you located? I am in Milwaukee.

To quote the manual, Radio Receiver R-392/URR is a high-performance, compact, rugged receiver designed primarily for vehicular use. The receiver provides reception of radiotelegraph, voice, and single-channel, frequency-shift radioteletype signals within a continuous frequency range from 500 kilocycles to 32 megacycles. The receiver is immersionproof and is sufficiently rugged to withstand parachute delivery when mounted in a 1/4 ton, 4x4 truck prepared for parachute drop.

Nice old Bud 'Gimix' wave meter in good condition. Covers all
the 'old' ham bands. Only $4 with no reserve and just a few hours
to go!

Haven't opened it up yet, but when I fired it up again last night it
worked fine again. Some kind of heat-related failure I guess, but it's
pretty clear that it's not the meter (whew!) or the fuse bulb. I'll
let it run for a while today and see how it acts.

Thanks to everybody for the ideas!

73,
Mike, KK6GM

Selling my beautiful Kenwood T-599, R-599 station with matching speaker
in stunning silver face.
This is a super vintage station for the discriminating collector.
Excellent cosmetically and operationally.
They look outstanding and have produced super audio reports on the air.
Includes control cable for transceive operation, as well as original
manuals.
If you ever wanted The Twins, you won't find a better pair.
Yours for $425 plus shipping from Eastern Pennsylvania.
If not sold, they move to EBAY on Feb 14.
Pickup possible in Eastern PA, NJ area.

HALLICRAFTERS H2M-1000 All Mode 2 Meter XCVR on eBay at:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1213966859

This is a collectible Hallicrafters 2 meter tranceiver from the mid 1970s.
I beleive this model never went into production, making the units available
very low. This one is in very good condition. It has a minor surface
scratch on top, about 1 inch long. The second LED from the right on the
frequency readout takes about 5 minutes for all segments to light (cause
unknown). The mic and holder on the radio (see photo) are not Hallicrafters
equipment. This unit is in very good condition, but is being sold as is.

I have an old 7-CRT telemetry monitor that I'm trying to fix up.
In the power supply it has two strange tubes which are probably HV
regulators, probably corona regulators, numbers hard to read, may be CK
5177, 7-pin miniature tubes, with a top cap. One is missing,
the other arcs funny. I can't find these in any tube manual, anybody have
any idea what they are? Can I replace them by a stack of zeners? How many
volts? Thanks for any info.

From: wb0tua@my-deja.com
Message-ID: <965dep$f7s$1@nnrp1.deja.com>
Source record: 56542

Dear Friends,

I just picked up a Collins transmitter and I'm
not sure how to tell if it's a 32V1 or a 32V2.
Can anyone tell me the difference? I can't seem
to find a name plate or any other info on it that
would indicate which model it is. I'm farily
certain it's not a 32V3 since the case has a
hinged lid on it.

Thanks for any help you guys can give me.

Its probably FBX, crystal filter version of the FB7. Uses same plug in coils as AGS. I own several. They are vintage 1933 and very usable today for AM, CW or SSB. They are definitey worth someones time, if you are not interested in restoring them.

I used a surplus military receiver in the early to mid 60s that was a large (maybe 2' or 3' x 2' or 3' x 2' or 3') grey box into which I plugged in one of three tuners that I had for it. Each tuner plugged in one at a time and had a vertical handle on it. It slid in on rails. It had a rotary knob and I viewed the frequency readout dial in a window in the tuner. As i recall, the tuners were a darker color, maybe wrinkled flat black.

One tuner covered 30 - 50 MHz. One covered 118 - 136 Mhz and one covered 225 - 400 MHz. I have been told that this model was the AN/APR-4.

I wonder if you can help me identify the unit I used in the 60s. Do you have any pictures that would help me identify it?

Silver

Ahh, not necessarily so! I sell an 83 eliminator that works VERY
well, and is a plug in replacement in the vast majority (95%+) of
tube testers. $12.50 gets you a solution to the dwindling 83 supply
problem, and it really does work well.

Drop me a note if I can help.

Mention of BC Electronics brings back memories of my son's venture into the surplus business. We had heard of a scrapyard in the area (CT) where IBM was dumping all their old first generation computers. We found parts such as Selectric keyboard consoles, some found to be in working condition; meters, power supplies, energy storage banks (caps), endless racks of tubes, resistors, capacitors piled up outside in the rain, literally in mini-mountains. Almost brought tears to our eyes. We built many things for the shack that used parts we got there. (After we dried them out.)

But inside, in dozens of 55gal drums, were the Mallory "computer grade" caps, hundreds of them. Some were encased in what is usually used today, a clear vinyl sheath that shows the aluminum case; others had black paper jackets.

The dealer, who's interest was in the metal, he didn't know what they were, sold them to my son; 3 cents apiece for the black ones, 5 cents for the silver ones. My son sold them to BC. Paid for his first year college books.

The receiver you describe was the RDO, a shipboard version of the
AN/APR-4. The RDO did not have the Narrow/Wide IF selector, but had three
meters instead of the one on the APR-4. The panadapter associated with
the RDO was the RDP, five inch diameter CRT and 30 MHz center frequency.
The RDO used the APR-1 and APR-4 tuning heads;
TN-1/APR-1 (38-80 MHz)
TN-1B/APR-1 (38-95 MHz)
TN-2B/APR-1 (74-320 MHz)
TN-3B/APR-1 (300-1000 MHz)
TN-16/APR-4 (38-95 MHz)
TN-17/APR-4 (74-320 MHz)
TN-18/APR-4 (300-1000 MHz)
TN-19/APR-4 (975-2200 MHz)
TN-54/APR-4 (2000-4000 MHz?)
CV-253/ALR (38-1000 MHz) four bands in one tuner with separate antenna
connectors

Hope this helps,

John WA4WDL

1443. WTB: radar altimeter display

Just heard some strip mall in the area of Ham Radio Outlet's
Newark De outlet burned to the ground last night. Was it them?
Hope not! Or did all that jap radio junk that's built inside like a
$69.95 K-Mart VCR gone up in smoke? Ham radio's dying anyway
so it's probably no loss in the long term. Try this sometime. Open the
hood of a Kenwood or Icom HF and a Daewoo or Hitachi VCR or TV
alongside of it. See the thru-hole components placed haphazard, chinzy cheap
wirebundle inter-connectors, unplated steel chassis that rust,
SMT resistors and caps placed at angles on the board and thin
polycarbonate plastic used everyplace in both. Difference is that hams
pay $1500 for HF rigs and everyone else pays $79.95 for identical components
and workmanship from the same jap factories.

Selling a good condition National HRO-60R (rack mount model), complete with the B. C & D coil sets. Radio is in working condition, but will probably require an alignment or other work. Front panel has one extra hole drilled for an indicator light. Comes complete with copy of the original manual. Price: $225., for PU in Greenville, SC or plus shipping.

Source record: 56467

Hi All,
I hate to add to the list, but I have tried all avenues possible to avoid this posting.
BEWARE of FELIX TISSOT located in KTN, Alaska!!!!!
I bought a Panasonic RF4900 from him, he promised money back if not satisfied. The set arrived with SEVERE damage due to poor packing. I told him I would send it back in the original packing, he wanted no part of a return. He said he would return the purchase price minus shipping and then REFUSED to answer/acknowledge many emails sent over a 4 week period. Most recently, I gave him a last chance to make things right, he still REFUSES to answer. Due to these conditions, I must therefore warn all in the Newsgroup that this fellow is a lying sack of dog sh*t as well as a thief.
Granted, Alaska is a long road trip from here, but you never know when a disgruntled 600 pound gorilla may just happen to come knocking at your door....
Those of you that have had dealings with me in the past know that I am a reputable seller/buyer, so take this warning for what it is worth.
rgds,
Mark S.

Jerry - You made the assumption that the twit (read troll) even has one to send back.

Of course when the moron looks under the hood of his "American" car, he doesn't have enough brains to know the air conditioner compressor on his "Mopar" is Mitsubishi or the speedometer on his Harley says "Nippon Seki" on the very bottom either.

Source record: 56487

Hi Bill,

I have a 680 that I'd love to sell you. (Sitting here at work, I can't remember if it's a 680 or a 680A). It's not perfect. Here's the deal:

Working fine on 80-10m CW last time I had it on, which was about 10 years ago. Never tried it on 6m. Never tried it on AM. I'm sure it needs new filter caps by now. Original crystal socket has been replaced by a ceramic unit. Tune and Load knobs may not be original (not sure) but they look right for gear of that era. Otherwise, original knobs. Gray hammertone cabinet in good condition. Rust spots on the bottom.
Panel is fair at best - has some paint missing around the edges and has a spot the size of a quarter that looks like some kind of glue. All markings are legible. Original meter (square plastic) was working when last used. All tubes included. No manual.

Also have a dandy Millen Variarm VFO and original manual that I used with the Globe Scout. It's in excellent cosmetic condition. I't hasn't been on in 10 years either, so it will no doubt need new filter caps, too.

Name yer price for the Scout alone or with the VFO.

Thanks for the kind words Joe! I make these units
myself, so I can supply them with no problem. I have
about (100) 4 pin tube bases on hand, so the supply
is good.

The darn 83s have just dried up though. I can't find
any quantities of them at all. So if you have an 83
socket, you'd be wise to consider the swap. Don't
put any other rectifier in place of the 83, you need the
low impedance of the real 83 (or my eliminator).

Thanks for the bandwidth.

Don't feel bad -- I sold my KWS-1, 75A-4 *AND* SC-101 for $850 in
1975. I had just done a major mechanical overhaul on the KWS-1...
those Beckman turncount knobs? Something like $44 apiece and made
of pot metal! I could retire early on what people are getting for
this setup now.

Guys,

I am looking for a Johnson Viking Ranger I or II. There are Rangers out there but I am not looking for the garden variety Ranger. I want a nice one!!

I will purchase outright or will trade a Valiant I. The Valiant is in nice condition .. on air a month ago .. works well .. but not as nice as the Ranger I am looking for.

I also have a Hammarlund HQ-170A that IS real nice, I mean real nice.

I can send pics of either if you are interested in a trade. I will need pics in return. I will drive a ways to pick up or trade these because I want you to be as happy as I want to be with my acquisition.

Thanks,
Larry W9MDX

1492. FS: Swan 240 SSB Transceiver

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-02-13 01:46:27 UTC
From: sabbatai_zvi@NOSPAMhotmail.com
Message-ID: <3a889070.10924683@news-server>
Source record: 56402

FOR SALE:

Swan SW-240 HF SSB Transceiver
Covers the 20, 40 and 75m bands. Looks very good -
two small chips off s-meter case but otherwise looks excellent. Sold
as-is and untested but it
appears complete. It has all of the orginal knobs.
the case is not scratched up or dented. No rust.

There are no modifications that I can see.

No power supply comes with the rig. It will run
with the Swan SW-117B PS or other similar Swan units.

Will sell the SW-240 for $120.00 plus shipping

Pictures at:
http://home.cfl.rr.com/happysurfer/radios.htm

1494. Looking for someone who can repair KWM-2

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-02-13 02:55:31 UTC
From: "Lee K. Gleason" <lgleason@houston.rr.com>
Message-ID: <Dm1i6.15400$3B1.3078645@typhoon.austin.rr.com>
Source record: 56404

I picked up a KWM-2 and power supply a while back, hoing to fix it myself.

After sitting on my bench for a number of years, I realize that It's a
project beyond
my capabilities. The receiver section only produces a selection of assorted
howls, and
the transmitter section...well, I didn't want to try it before I could
receive...

Anyone know of a good outfit that does repairs on such a rig?

Lee,

WA5VVT in Ark is a great repair center for KWM-2. However, I would check
the relays and gently clean them if they are open frame.

Source record: 56409

I have a Drake T-4X transmitter & R-4 receiver for sale. The T-4X is complete, excellent front panel. All correct knobs, cabinet could use a repaint. Copper chassis isn't too badly marked. Complete with copy of the original manual. No extra holes or modifications evident. Could use a generla clean up. Untested. Price: $125. plus shipping.

The R-4 is a very low serial number (0031 I believe). No cabinet. Front panel is very good, and all knobs are correct. Moderate corrosion on the copper chassis. No extra holes or modifications evident. Complete with copy of the original manual. Price: $100. plus shipping.

Both sold as a pair: $200., plus shipping

Jon

Collectors of European equipment typically would prefer the original tube
and reserve the diodes for instances where the tube cannot be found.
Remember, with diodes you must always add power resistors in series to
compensate for the loss of forward dynamic resistance.

Message-ID: <3A89DB25.7EB6@worldnet.att.net>
Source record: 56427
Cross-posted to: rec.radio.amateur.boatanchors,rec.antiques.radio+phono

To Old Radio Lovers....

BoatAnchors are everywhere in the March QST!

The first thing you will see is the cover: A great photo of a Hallicrafters HT-6 transmitter and a SX-43 receiver.

The Hallicrafters article is on page 48 (4-pages plus the cover) - Hallicrafters' Chevy, Buick and Cadillac. It about the Hallicrafters transmitters, designed by Bob Samuelson. Article by Mike O'Brien, K0MYW.

My regular Old Radio Column is on page 104 (1-page). This month it is on the BC-625 2-meter transmitter surplus conversion, part of the SCR-522, a WW-II VHF Xmtr-Rcvr.

Classic Kits - Unbuilt or Rebuilt by George Blahun Jr, KS1U, on page 28 (4-pages). George writes about taking a kit apart, then carefully rebuilding it. This should get a lot of attention. You can't buy them any more, so why not rebuild them?

The Great Paper Chase by Billy B. Johnson, WB5RYB, on page 42 (2-pages). It's a great article on collecting Old Radio paper. Some interesting examples are shown.

Last, while not a true BoatAnchor the circuit has been around since the 1920's. On page 32 is an article on building a Tuned-Radio-Frequency (TRF) receiver for tracking RFI by Rick Littlefield, K1BQT, (5-pages).

You can also spot several BoatAnchors in the Up Front photo section.

So there you have it, it's the best BoatAnchor issue in years! If you don't subscribe, why not do so now. I'm sure the news stand copies will go like hotcakes.

FYI - Subscriptions are only $34. per year, $28. for seniors over 65. See http://www.arrl.org for more information. Or you can write to ARRL, 225 Main Street, Newington, CT 06111-1494, or call toll-free 1-888-277-5289 during business hours. Get them to start your subscription with the March 2001 issue. Membership is included with the subscription. Tell them I sent you.

1521. Class A,AB1,AB2, RF Power Amplifiers

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-02-14 01:16:53 UTC
From: Reg Edwards <g4fgq.regp@btinternet.com>
Message-ID: <96cm7n$94e$1@plutonium.btinternet.com>
Source record: 56429

NOW AVAILABLE :

New Program "TETRODE1.exe"

CLASS A, AB1, AB2, C OPERATION OF TETRODE RF PA's

Obtain a minumum of info from a tube (beam tetrode or pentode) manufacturer's data sheets or curves. Enter in program with DC anode supply volts, DC screen volts, minimum anode volts, maximum control grid volts, required operating angle, intrinsic Q of tank coil, required working Q of tank circuit, frequency.

A useful feature of this program is direct entry by the user of the anode current operating angle. This angle controls the various combinations of linearity and efficiency.

An important data entry item is the control-grid to screen-grid amplification factor, Mu. If the manufacturer's value is not available it can be guesstimated by varying it until other characteristcs become compatible with what info there is available.

The program computes RF power output, anode loss, screen grid loss, tank coil loss, DC-RF power conversion efficiency, peak and DC anode current, DC screen current.

Also tank inductance, tuning capacitance, turns ratio for link winding to 50-ohm load, source impedance looking back into 50-ohm output terminals. Note that a congugate match does not exist at this point.

Grid circuit conditions are computed:- peak RF drive voltage, negative DC grid bias, input impedance, drive power, DC grid current, grid bias resistor, grid current operating angle, grid dissipation.

Covers power outputs from QRP to 100KW.

Push your own precious and delicate linear up to and beyond its safe working limits without any fear of accidentally blowing it up.

Highly educational even if you never use this program in anger.

Download in a few seconds from website below. 52 kilobytes, 1 file only, not zipped up, run immediately.

Wonder what anyone thinks about a tube or boat anchor contest sometime? Maybe just a part of a weekend or part of a day just using all old stuff / tube gear? Is that even a worthwhile idea?? Might be interesting to see the feedback. 73

TRADE, a New in Box Icom IC-W31A 2/440 hand held +- cash
for a Drake TC-6 six meter transmit converter in VG- EX condition.

The W-31 is truly new in box, never used. It was obtained from a
a ham who bought 10 of them new, put them on a shelf, and never
used them. The radio is complete with plastic wrap and all accessories
(plugs, belt clip, etc.) that normally comes with this radio.
Protection
tape is still on the display. Note this radio has out of band 800 MHz
coverage
and is not cell blocked.

I want to trade is +- $$ for a Drake TC-6 in VG to Ex condx. It should
be
complete with power cable and manual. I will buy a complete station
should you not want to split it up.

I may consider trades +- $$ for a Drake MN-2700 with B-1000, or a
Hammarlund
HQ-180AC. Please, only units in VG-EX condx.

Please contact Gene K1NR/3 at K1NR@ARRL.NET or by phone days at
610-354-3306.

Note, if no replies in 1 week, the Icom goes to E-bay. I will however
consider offers
before E-bay,

Thanks for reading this.

Depends totally on the equipment :-)
If it's a late-sixties home-brew receiver made up of parts from a large period

of time I probably would do this to free special parts for another project.

1532. HRO Receiver manufacturing date question

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-02-14 12:56:47 UTC
From: berntd@prism.co.za
Message-ID: <3A8A80F4.B77A7C08@prism.co.za>
Source record: 56442

Hi,

I have very recently accuired a HRO receiver made by National.

I have searched the net and downloaded all the info and manuals
available.

I have a few queeris though and maybe someone out there has the answers
I am looking for.
Here goes...

I am not sure exactly what model I have. The information is
contradictory.
Here are the details:
It is rack mount.
Grey inside chassis.
Plastic S-meter with red/brown scale.
Square IF coils.
A plate around the audio (42) valve, not a conplete encapsulation like
the other valves.
Black PW dial.
National label on front panel at top right.
Top right knob has no metal disc like the others but a pointer.
No audio transformer.
Big glass valves including 42, 6C6 and 6D6.
Coils sets A,B,C,D,E,F and G.
It has a plug in crystal filter.
Molded capacitor insulators.
Serial number is 194F.

1: The serial number is not on the rear above the connectors as
mentioned in the article (see below). It is on the leftmost IF coil. The
serial numbet is 194F.
According to some article "Dating early HRO receivers" it should be a
1935 model.
However, the article carries on saying that the plastic S-meter was
introduced much later and that the plug in crystal filter disapeared in
'39-40.

Heck, I don't know what I have here. There is no power supply and no
speaker but a set of antique headphones. The set is in very original
condition and I wonder what is is worth.

Any opinions?

>any more, so why not rebuild them?

Lots of fun! I did just that a few months ago with a sad ol' Knight T-60 that I dragged home from a hamfest. It was sitting forlornly in a box of dirty ol' junk underneath a table, with a price of $25 stuck on the top. When I got it home and took the cover off, I was shocked to see just how UGLY it was inside. It wasn't very dirty, but the workmanship of the original construction job was terrible, and some subsequent repair work was even worse. Truly, this was the very worst I've ever seen in 24 years of hamming (and I have done LOTS of BA repair and restoration in that time). There was only one course of action. I disassembled the rig down the the bare chassis and rebuilt it with all new components, working from a photocopy of the original assembly manual. It really was just like building the original kit! Because I used what components I could find locally, I did have to make a few changes here and there (such as jury-rigging radial-lead filter caps instead of the original axial-lead jobs). When I fired it up for the first time, it worked perfectly, and I'm sure I had a big, silly grin on my face! Its front panel will never look "like new", because a previous owner scratched preset markings for various bands into the front panel around the Plate and Load controls. But inside, it looks quite nice, and it works like a new one!

By the way, it warmed the cockels of my heart to see the subject of the rebuild article. My first rig as a novice was a 723!

If YOU haven't tried breathing life back into a BA, you have no idea what you're missing!

From: dhrnsn@dejazzd.com
Message-ID: <k5zi6.2016$dp4.66468@nnrp1.ptd.net>
Source record: 56297

For sale -

Drake 2-A receiver, with 2-BQ speaker & q-multiplier, and 2-LF low frequency converter

Excellent condition, both appearance and working condition.

All original, except a previous onwer did install an so239 antenna connector in the factory pre-drilled hole.

Works great, one of my favorites to listen to. AM sounds great with the wide 4.8 kc selectivity (ssb with 2.4 kc selectivity sounds better too!). I never used the 2-LF, so I can't confirm it works, but my understanding is that there is very little inside of it to go wrong - also, it requires an accessory crystal (27.9 for .1 - 1.8 mc, or 26.2 for 1.8 to 3.5 mc).

Receiver has crystals for 80 - 10 meters, sorry, no accessory crystal for the 2-LF.

I can email pictures (haven't taken any yet, so request what you'd like).

Excellent receiver to use, or for the discriminating collector.

$225 plus shipping for everthing.

1543. WTB: $500 or more for 6146B ...

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-02-14 21:38:03 UTC
From: Larry <net1@netohio.com>
Message-ID: <%UCi6.2597$sn5.215377@newsread2.prod.itd.earthlink.net>
Source record: 56303

Madness yes! I'll gladly pay $500 maybe more, depending on the drool factor, for a 6146B --- if it has a nice clean Viking Ranger I or II attached to it. The Ranger must be MINT. I have a roll of paper towels handy and if the drool is more than can be cleaned with a half roll of Brawny's, I might pay more.

What is my definition of MINT. MINT means that it is essentially like new. It must work at rated specifications, be clean with no mods or extra holes and have all of the paints still attached to the front panel with no marks scratches or dents. Now that's a tall order for a 40 year old rig but $500 ain't chicken feed either. If it is restored, that's OK, as long as it's nice and clean and works!

If you are not within reasonable driving distance to Huron, Ohio, I will require pictures of the inside (top and bottom) and the outside (front, back, top, and sides). You want CASH, I want proof! If you'll settle for payment upon my approval of the rig, no pictures necessary.

Ebay terminology like "collectors quality", "MINT, except for huge gash in meter face", or "OH-BOY", or L@@K, or "9.5 out of a possible 10 except for yellow paint spill on cabinet top" will be caught by my email filter and discarded. And for you Ebayers out there .. keep the darn cat off the equipment! Declawed or not, radios are not made for them to nest on!

Thanks to all for your patience but I want a Ranger!

Larry W9MDX

That's high, but for the real shockers, do a search on "unbuilt Heathkit".
There are unbuilt HW-101, HW-12A and HG-10 kits running right now. The prices
are - well - slightly higher than original.

Many of us would love to find that "drool material" boatanchor, Larry.
In the case of "drool material" Rangers, there really aren't that many
out there. Those that were out there have pretty much been snapped up
by boatanchor afficionados, who enjoy and appreciate them, prizing them
quite dearly.

To expect to pay $500 or so for a "drool material" Ranger these days
may not be realistic, if you consider that Rangers in rather beat-up
condition are easily going on eBay for $300 plus. To restore a Ranger
properly to "drool material" condition requires a great deal of time
and expense, adding at least another $300 or more to it's cost. Then,
one has a "drool material" Ranger. Usually with at least $500 plus
invested into it. Add the inherent "drool material" value such a
Ranger has to it's owner, and I think realistically you're talking
about a Ranger worth quite a bit more than $500 or so to it's owner.
And put it on eBay, display it well there, and it's likely to bring
the seller closer to double the $500 figure than much less than that.

But we keep on looking....almost like playing the lottery! <g>

It's already being done!

There's the "Classic Exchange" (CX), the winter version of which was held last weekend. The AWA sponsors a couple of contests - in some, you get a multiplier for using pre WW2 gear, and in the other you are required to use a transmitter that was "buildable" in 1929 or earlier. ("Buildable" means you can't use tubes or types of parts that were not available in 1929)

I use my "all hollow state" rig all the time, contest or no.

1558. FS: Westinghouse MW transmitters

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-02-15 06:54:55 UTC
From: Rory Davis <n7cr@bellsouth.net>
Message-ID: <U4Li6.1749$466.113888@news1.atl>
Source record: 56318

For you collectors of HEAVY iron:

I have for sale a quantity of ca. 1948 Westinghouse type MW transmitters in the New Orleans area. These have been shut down from commercial service as HF CW transmitters with a nominal 1.5 to 2 KW output. They are still in place and need to be removed to make way for new transmitters. They are currently fixed tuned for one marine band but are easily modified for other bands. The outputs are 50 ohm using type LC connectors.

In our configuration, three or four RF decks are powered by a common power supply, typically 4KV @ 6A. There is a separate power transformer (about 500 LB) which is configured for 3 phase, 240V input. The original mercury vapor rectifiers have been replaced with silicon diode stacks.

Excitation was by a separate synthesized exciter which will be included, although the channel filters would need to be replaced for other frequencies.

Most are still operational, some have been cannibalized for spare parts.

There is documentation, however it consists mostly of modification manuals and a few (very fragile) hand-drawn and blueprint schematics and wiring diagrams.

Additionally, I have three dual-frequency Westinghouse MW MF-CW decks, 3KW output. Two antenna matching networks are available as well. These were the 500KHz transmitters. Two of the MF decks have been cannibalized to keep the third one working.

Because of the size and weight, obviously this is a pick up deal only. Make an offer. I'd really like to see the best of these go to a radio museum, as they were used to send the final commercial CW messages from east of the Mississippi. It would be a darned shame to send them to the scrap heap.

73,
Rory Davis N7CR

Message-ID: <6yLi6.4513$jP.27303@typhoon.mw.mediaone.net>
Source record: 56319

Does anyone out there know when GE stopped publishing the Ham News? I know they started
in January of 1946 and I have most of the first 10 years issues, just wonder how many more
I have to acquire.

I have started on a project to compile the complete collection of GE Ham News with the
hope of scanning it all and compiling it into a CDROM format. The idea is to preserve some
of the excellent articles which many hams today have never seen, nor probably never will unless
something is done.

Plans are to provide an searchable index as well as a table of contents, hopefully better
done than the ARRL's QST CDROM sets. Initial thoughts lead to using PDF format documents,
but I am open to suggestions.

1560. FS.C12 TRANSCEIVER,(Tube) British HF

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-02-15 10:10:27 UTC
From: "radio-exports.com" <info@radio-exports.com>
Message-ID: <t8nangpi1bdd15@corp.supernews.co.uk>
Source record: 56320

The British C12 transceiver,evolved as a replacement for the earlier W.S.19 transceiver, of WWII vintage.
Except for the fact that the C12 is an HF transceiver,(the 19set also had vhf),it is basically an improved version of the W.S.19 (and is interchangeable with it in most situations).It is similar to the WS19 in size,but of much smarter appearance!
Overall,the C12 has a better performance than the W.S.19 and is of superior construction.

The C12 consists of an AM and CW sender/receiver.
The set may be pre-tuned to any of two alternative frequencies and switched instaneously from one to the other,without re-tuning.To provide this facility,all tuning controls are duplicated,aerial tuning included, and a single switch is used to transfer the tuning from one set of controls to the other.Sender and receiver are tuned automatically to the same frequency.
The overall frequency coverage is 1.6 -10.0 Mc's.

The example which we have for sale at radio-exports.com, here in the U.K.,is in all original condition. Included with the set,is the correct original power supply, designed to operate from 24volts dc (@ a max of 9amps on voice-send),together with the original interconnecting cable and plugs linking the psu to transceiver.
Also included, is the harness for the set,comprised of interconnecting cables,junction box,headphones and microphone.

This is a particularly good example of the C12 transceiver and it's accessories.It is in excellent condition externally and has an untouched, mint condition, interior.The harness,is as new.
To make life easier for anyone not used to operating these sets,a copy of the User Handbook will be included with the set.

The price for the transceiver,which includes air freight to the USA, is only $495 US Dollars.

If you would like more information,or wish to order,please contact Graham Leo info@radio-exports.com

Thank you for your time and interest.

1563. 5 Rare Eddystone receivers FS

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-02-15 13:46:41 UTC
From: radiomatt@aol.com
Message-ID: <20010215084641.02330.00000328@ng-mk1.aol.com>
Source record: 56323

Selling off part of my British Eddystone receiver collection

All these radios are in Fed Osterman's book, or can be seen at the Eddystone website:
http://www.qsl.net/eddystone/welcome.html

THE RAREST!!!
Model 880/2 22 tube receiver built along same operational design lines as 51J series Collins (30 1-MHz wide bands within which you tune around).But better as it has panel mounted speaker and factory USB/LSB detection. All original except kilocycle tuning knob. Covers 500 khz-30.5 MHz Working, rackmounted unit $1500 + shipping

Model 830 13-tube tube radio with wide tuning dial. SSB detrection. 300 khZ 30 Mhz. Works fine. Rare unit $750 + shipping

Model 1837/1s Also called the MARCONI MARINE "PACIFIC" This is a solid-state unit that worked fine, but is now "locked up" (display shows all "9"s),. The lockup was repaired once before, but the radio shop that did repair is long gone. Complete, but sold AS-IS. $650 + shipping

Model 750 11 tube radio that covers 480 kHz to 30 MHz. Big slide rule dial with bandspread too. Dial string of off one pulley (I cannot see well enough, and my fingers are too stubby to put it back on track), but radio works fine. The rackmount "ears" shown in Fred Osterma's book are not included, use it as a table radio. $700 + shipping

Model EC-958 (Grey front panel) a superb solidstate radio manfactured by Eddystone, but sold by other companies with their own names on them (Debeg, etc). Working condition. Very good on VLF Covers 10 kHz to 30.1 MHz $800 + shipping

Located in Southern NY state.. Shipping extra. Overseas OK but payment must be by bank wire transfer.

Source record: 56327

Radio Shack is in the process of switching over from the REALISTIC brand name, to RCA branded speakers, and they're dumping certain older models.

The absolute best deal right now is their 40-11991 speakers, a small cube shaped 4" speaker in a black wood grained vinyl case, but magnetically shielded, for under $5 each. The front metal grille is also black.

The unit is not plastic and actually pretty heavy, a good sign. I bought a bunch of these and hooked them up to my various radios...no more switching plugs! They look pretty good on a shelf, lined up side by side. The physical size is 5"x5"x4.5"

The current RCA equivalent model XTS-50AV,(40-5024) is $20 , but be sure you ask for it by the "old" stock number (40-1991). As far as I can tell, they're identical.

John:
I wish I could provide better help here, but try to find Kenneth Bay, he should be a W2 something, if he isn't SK. I used to remember his call, but I can't pull it out of the mental fog. He was involved with that publication for a short time in the 50s, and may be able to point you to whoever the last "Lighthouse Larry" was, and when it folded. I suspect late 60s, early 70s. IIRC, it was published by the tube department down in Owensboro, long gone, last operated by MPD, but most of the articles actually came out of Syracuse and Lynchburg. Another possible contact is Howard Lester, W2ODC in Schenectady.

Also try working 29.000 to about 29.1000 AM mode, where there are many ops using hollow state most Saturday and Sunday earlier in the day.

FOR SALE:

Swan SW-240 HF SSB Transceiver made in 1964 - their next-to-last
production run. It has all of the orginal knobs. The case is not
scratched
up or dented. No rust. There are no modifications.
Covers the 20, 40 and 75m bands. Looks very good -
two small chips off s-meter case but otherwise looks excellent. Sold
untested since I have no ps for it, but it appears complete.

Will sell the SW-240 for $120.00 plus shipping

Pictures at:
http://home.cfl.rr.com/happysurfer/radios.htm

NOTE: remove the "NOSPAM' to e-mail me.

Hi Matt

Sorry to tell you this but your prices are VERY high indeed.

These sets would cost much less if bought in the UK and shipped by Air Mail
to the US.

Your prices are in fact about DOUBLE market value.

Hi all,

I need some input on the Drake L7 HF amp. I can't find much in the way of reviews, complaints, etc. on the amp (online). The nice look of the amp and a few other things caught my eye and I was thinking about purchasing one. What are the pros / cons of this amp? Would I be better off with a Kenwood TL-922A ?

I have looked at the online Drake museum already.

Thanks,

Scott.

Most likely the Ranger you're referring to was the one on
display at the Gaithersburg, MD Hamfest a couple of years
ago. It was for sale by Dee Almquist, who had beautifully
restored it to "drool condition", stripping down the front
panel, re-stencilling it with lettering exactly like that
which was originally done by E.F. Johnson, and repainting
it with factory-matching paint, then sealing the paint job
with a clear lacquer "invisible" sealer. That Ranger I
truly was a masterpiece and showpiece, fully restored both
physically and electrically in a most professional manner
b Dee. And a value for the $600 or so price Dee was asking.

Don't know if he's still restoring Johnson gear these
days or not, but if so this would be a good way to go
in obtaining a "drool material" Ranger. No doubt the
price has gone up some during the past few years, like
everything else, but it would still be tough to find a
nicer "drool material" Ranger anywhere.

Hello John,

Yes I remember GE Ham News. I have a book (spiral bound) that has some compiled articles from HN. One article decribes the SSB Jr. which is the forunner of the CE 10A transmitter. (phasing rig)

I remember a HN article about the construction of a KWM2 like transceiver. Do you have those issues ? I would love to have a copy of that.

I have been a ham since 1954. W3YCI. I lost my ticket 20 years ago from failure to renew. Now that I am retired, I tested back into HR a year ago. Surprisingly, I managed to get my ols original call back. I am not on the air yet. I am trying to learn about transistors and ICs. I will build something for CW on 30 and 40 meters.

You really dredged up memories with your inquiry about GE Ham News.

73,

Dick

W3YCI

1600. FS.A41 Military TX/RX (U.K.Army 1960's)

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-02-16 10:06:47 UTC
From: "radio-exports.com" <info@radio-exports.com>
Message-ID: <t8pusonjhr4d14@corp.supernews.co.uk>
Source record: 56359

Interesting boatanchors constantly arrive at radio-exports.com and the A41 Military Tx/Rx (officially, and rather quaintly,described correctly as Wireless Set A41) is one of the recent additions to our constantly changing stock.

This well built,compact and relatively lightweight set, dates from around 1960 and was designed for the British Army, for use as a Manpack/Groundstation set.It was mainly used by infantry units.

The WS No.41 is a vhf ,fm ,voice sender/receiver .It is continuously tunable over the range of 38Mc's to 55Mc's.,so the set has obvious potential for practical use on the amateur bands.

The sender/receiver is built into the upper section of a metal case.There is provision for batteries (not included) in the lower part of the case.The set is mounted on a back-packing frame ,complete with webbing straps.

To cater for both ground station and for use on the move,three antenna sockets are provided; short rod ,long rod and remote aerial feeder.

The set is very well equipped with accessories and includes the following. Earphone and microphone headset,telephone handset,signals satchel,antenna connecting cable,folding rod antenna ,flexible antenna adapter,matching unit,audio extension adapter,audio extension lead,artificial antenna and a copy of the Operator's Handbook.

The set and it's associated equipment are all in good original condition.

The price of this potentially very useable transmitter/receiver,which includes the cost of packing and air freight to the USA,is just $410 US Dollars.

If you would like more information or wish to order,please contact Graham Leo info@radio-exports.com

Thank you for your time and interest.

Message-ID: <96k731$1u6$1@slb2.atl.mindspring.net>
Source record: 56361

I been selling many of my small items off to clean up.
People keep sending me these Western Union Money Orders that can not be cashed.
I always state US postal money order only, am I doing something wrong ?
Perhaps I should say "UNITED STATES POST OFFICE ISSUED MONEY ORDER ONLY"
Has anyone else had this problem.

This is why:
I am in New York
Agents will take cash and issue them everyware but will not cash them.
No one (not even the local Western Union)
Here is the deal: Western Union owned by
Integrated Payment Systems out of Englewood, Colorado and no one will cash them.
People are getting then at every five and 10, candy store in America but no one will cash them.
A 1-5 week wait process for my bank for a $10 Item.
After contacting the company (a 20 minute wait on the phone for a English speaking person) she told me they are for depository only)
How could these be called money orders and not bank checks ?

I got one of those d****d things once. The closest place to cash
it was in a chain grocery store about 20 miles away...across the
water from me. I didn't realize they were so hard to get rid of.
On the other hand, my local bank had no problem with some "Bob's
Money Order, Las Vegas" type of thing.

Sellers in citys beware:
I have had this trouble before, I called the company it really NOT a money order.
This get's even better !!!

Western Union is not the same anymore it is Integrated Payment Systems.
Remember I am in the tri state area.
Due to much frud agents 100% permission to use there own desgression (to protect themselvs)
on cashing these.
Agents at the local Kaymart or candy store do not have computers links to Integrated Payment Systems of Englewood Colorado, nor will they call and wait 1/2 hour for a operator in English to verify the *CHECK*
.....Now THEY SO THE ALL SAYING NO !

Past experiences:
So funny I went to a Western Union agent locally I have this Indian guy was yelling at me.....
NO NO NO NO NO ! we don cash that here "GO TO BANK, go to address on it.
(in this case about 300 miles)
We dont cash that here !
Went to 2 other Western Unuion "same deal" They treated me like a possible bank robber !

I go to my bank :
My bank said its really a *CHECK* and from this company Integrated Payment Systems handling so much welfare and people who dont have checking accounts to pay phone and electric bills.ect
"Said sorry we dont like these things and wont take a chance".....We can withdraw it from your bank account till it clears in 1-6 weeks!
Remember I am in the tri state area.
Due to much fraud New York State has given agents permission to use there own desgression on cashing these.
Agents at the local Kaymart or candy store do not have computers links to Integrated Payment Systems of Englewood Colorado, nor will they call and wait 1/2 hour for a operator in English to verify the *CHECK*
It this new screwy Integrated Payment Systems who owns Englewood bank of Colorado who owns who owns the Western Union name.

Source record: 56366

This Model NC183NR is rack mounted and has the entire rack cabinet included. It is in only fair-to-poor physical condition with a replacement transformer installed. It also has some blemishes on the front panel and one of the tuning knobs has lost it's 'beauty ring'. This unit is not working and will need attention but I think for the National buff, it will be worth restoring. I have been told it is a Northern Radio mod, but some of you will know more about that than I. It is sold as is and I will require shipping to be paid by buyer. I will double box. I have no manual and there are some extra knobs on the front and rear but they are factory installed I assume, and the extra knobs on the front are factory printed on the front panel. I have a fair picture (JPG) that I can send if you need to take a look at the front. Not a great shot but lookable. I will sell for $130. plus shipping costs. Thanks for looking. 73 John W4WAW email: jburgwynjr@aol.com

>> Is that a realistic price ?

Yes. A nice one in a cabinet goes for at least $1000 to $1200. A late production one in excellent condition can bring $2000 or more. Heck, they were almost $2000 40 years ago when dollars were bigger.

I have never had a problem with those I purchased gear from using Western Union money orders I get at any Kroger Grocery store.
They also cash them and Bank of America takes them with no problems. I usually just deposit them and they are there the same day (at midnight).

I have had problems with cashing US postal money orders. They want you to use at least 1/2 for postage before you get cash. The last one I got for $50 was refused at the local PO because I had only $10 worth of outgoing mail. I took it to the bank and deposited it.

If you need real money at your bank them spend the few extra $$ for a certified or cashiers check. I did this with a big ticket Transceiver I bought recently (money orders won't cover these items anyway).

Source record: 56374

My bank has no problem with anything that has the routing information on it that is correct. However I've had to take a Canadian Money Order to the US Post Office and they merely asked me for my driver's license for ID and gave me the cash for it. I've found it's better to go late in the day when they have more cash on hand however.

I'd suspect your post office treats a USPS Money Order like a check and doesn't want to give out their limited cash for it when you can easily cash it at your bank. The Canadian Money Order can't be treated like a check and my bank said there would be a $10 or $20 fee and that they had to have it negotiated by a third party service at a charge to them as it wasn't truly a check.

You can always buy more than one Postal Money Order for large ticket items and send them to the seller if he/she insists on a USPS Money Order. If the ticket is that large, the cost of 2 or 3 or more money orders is a very small percent of the total cost. It could well be less than the cost of a Certified or Cashier's Check depending on how customer oriented your bank it.

I am helping the XYL of a recent SK in Southern Rhode Island dispose of his radio equipment. There is quite alot of old gear and parts. The following is just a partial list of equipment I have checked out. Please reply to me with queries - hopefully you could come pick stuff up.

Thanks, Brian K1NW

Lampkin Labs Communication Service Monitor, Type 107C (Ser. No. 661), clean & works

Radio Shack DX-160 , not presently functioning, no accessory speaker

Heathkit GC-1A, condition unknown, with manual

Hammarlund HQ-140-X, clean, working with manual

Astatic microphones (2), model D-104-C, clean but condition not determined

Heathkit Oscilliscope, model 10-103 (Ser. No. 06341), clean and working, manual

Philips Oscilliscope, model PM-3200 , clean and working

Heathkit dip meter, model HD-1250 , clean but condition not determined, with manual

Heathkit IM-200 Freq. counter, with manual

EICO signal generator, model 315 , condition unknown

I seen this post and wanted to add my 2 cents. I was in a situation once where I took checks and Money Orders, be they postal, store bought - wherever. I had a Money Order given to me for a service I did and took it to the bank and they refused to accept it. So I had to have the person mail me a Postal Money Order or other certified form of payment. After that I refuse to take anything but a Postal Money Order. Especially if out of state, which the gentleman was.

Ericsson/GE PCS Parts Accessories

Good Day to All,
I recently came in to a quantity of 2 and 8 channel Ericsson/GE PCS HTs, most have 151.625mHz already programmed and have batteries and chargers. I am looking for a source of parts and programming information. Any assistance as always is greatly appreciated.

It may be safer than a personal check, but not much. If a person keeps the duplicate of the money order, he/she can take it back to the issuer, get reimbursed, and the money order will "bounce" when it's used by the person receiving it.

Best to accept nothing but a certified or cashier's check from a bank.

But isn't there a manditory waiting time before the original buyer can
ask for a reimbursement ("It's been three months and the recipient said
s/he hasn't received it yet, so it must have been lost in the mail....")

If there is such a waiting time, and if the recipient doesn't dwaddle,
I don't see how the MO could "bounce". But I'm sometimes pretty naive!

Hello,

I picked up a Zenith Trans-oceanic receiver and it is is need of
a dial re-string. The string has "jumped" off the wheels and is
a jumbled mess inside the cabinet.

The radio has the words "Wave Magnet" on top and the chassis
number is 6A41.

I think I will also need help on removing the radio from the wood
cabinet so I can re-string the dial.

Thanks in advance.

Greetings: A bank is not required to cash anything (including USPS money order) for a NON-customer. Why should the bank take a fraud or counterfeit risk for a NON-customer? If you are having trouble cashing a money order at a bank, it may not be the fault of the money order. On the other hand, if you a bank depositor, the bank will except just about anything for deposit.

1646. FS.RACAL RA17 L.F.Adapter

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-02-18 10:16:14 UTC
From: "radio-exports.com" <info@radio-exports.com>
Message-ID: <t8v86chuli8p7c@corp.supernews.co.uk>
Source record: 56256

Amongst the latest intake of equipment at radio-exports.com,we have a very nice L.F.Adapter,made by Racal for use with the RA17 series of receivers.

It is a type RA37 L.F Adapter.
The condition is very good,all control knobs & switches are correct and original and are unchipped.
The front panel lettering is crisp and clear and most important, in an LF Adapter,all of the screening covers and cans and cover plates etc., are present.

Specification includes:-
Five switched inputs, to either a Wide Band Amplifier or,
to switched Preselector ranges as follows:-
12.5 - 37kc's,37-110kc's,110-330kc's & 330 - 980kc's.
Aerial Tuning.
Aerial Attenuator - range 0-40dB.

The L.F.Adapter will be supplied with the following accessories:-
Full set of spare tubes (American spec).
Mains input lead and special Racal,mains chassis connector.
Copy of Operating Manual.
Copy ofMaintenance Manual.

We can thoroughly recommend this L.F.Adapter, which is a useful addition to Racal RA17 series of receivers.
The unit has been tested on air and is in full working order.

The price,which includes the cost of packing and air freight to the USA,is just $298 U.S.Dollars.

If you require more information,or wish to order,please contact Graham Leo
info@radio-exports.com

Thank you for your interest and attention.

1656. WTB: SX-73 parts or parts unit

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-02-18 15:41:46 UTC
From: Walt Novinger <wnovinger@nc.rr.com>
Message-ID: <_2Sj6.85741$k8.19661356@typhoon.southeast.rr.com>
Source record: 56266
Cross-posted to: rec.antiques.radio+phono,rec.radio.amateur.boatanchors,rec.radio.swap

I am looking for the "fingers" that make contact with the "pins" on the band selection drum on the SX-73 receiver. These fingers are mounted on phenolic boards that bolt to the chassis. I will buy the fingers alone or an entire parts unit having the fingers in good, working condition. The previous owner mangled the fingers on my radio when they took the drum out...it's easy to do and the fingers can't be repaired properly.

Please respond by email...thanks!

Walt

Walt,

I've been told but I have not checked this out, that there are additional
fingers used the ground some of the other contacts that are not in use. If so
those could be moved to the ones that have broken off. Check it on yours to see
if this is correct and let me know what you found. I heard it from another
source however he could have been thinking of the SP-600 instead.

I have a mil surplus modulator unit from APS-104 search radar (likely from B-52 bomber - 1960s vintage). Was used to fire a large pulse magnetron (in another unit). Contains a 4C35 thyratron, four 3B29 HV rectifiers and a few smaller tubes, oil caps, relays, transformers and other parts all in airtight aluminum canister. Also have copy of service manual (extra $5 for all, n/c for just the basic schematic & info). Still in original box, but used, collector's item, $55 (prefer pick up - box exceeds UPS size limit).(For an additional $20, I can shave down the foam insert and modify the box for UPS shipping, just takes a lot of time & effort to do this, and will cost at least another $40 to $60 to ship 105 lbs.) Great collector or experimental item. Located in southeast Alabama, 36330 zip. Email or call 334-347-5281 day/eve.

1662. Choppers or vibrators, plug-in type f/s

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-02-18 19:59:54 UTC
From: worley@snowhill.com
Message-ID: <3A902930.68ED493@snowhill.com>
Source record: 56272
Cross-posted to: rec.radio.amateur.boatanchors,misc.industry.electronics.marketplace

PLUG-IN CHOPPERS (or vibrators): mil-spec, unused, over 200 on hand. All are in sealed metal cans about the size of a mini tube and plug into a 7-pin mini tube socket. They have a coil and a SPDT contact which will close with just a few volts on the coil. Made by Hughes, p/n 992200-1. Equivalent to Airpax C-747, Oak Chopper type 610, and Collins 54-1021-00 Airpax 300. Unused, (some have chipped paint) $1 ea, 5/$4.00, 10/$7.00, 5/$15 or 100/$50. Shipping extra. Email or call 334-347-5281 day/eve.

The last boatanchor I rebuilt was a RCA TTU25B UHF TV transmitter built in August, 1952. It's a 25 Kw TV transmitter on Ch 58, and it was quite a job. It filled four 28 foot U-Haul trucks, along with the water cooler, feedline, and antenna. It was dismantled near Orlando, florida, and rebuilt a few miles east of Ft Walton Beach, Florida, (in the panhandle) It was a true boat anchor, with only two 1N23 diodes in the watt meters, and 16 6146's in parallel for the video modulator. It was nasty, and in sad shape when I took it apart, but it looked fairly good when we finished putting it back together, and fixed all the nasty modifications done by the engineers over a 40 year period.

This receiver is in excellent condition and works perfectly.
I bought it from an estate along with some other equipment.
It covers .5 to 30 MHz with bandspread on the ham bands
and receives sideband very well also. There is NO corrosion,
dents, dings, or scratches and looks new. It's all original.
It has the optional XTAL calibrator but no manual. I was told
it received little use since new and I can believe it, all the tubes
are the original Hallicrafters with the Hallicrafters logo on them.
$295 plus shipping.
73,
Chuck...K1KW

Doing some more "fix-it" work on my radios. Inside one of the BC-312, is written "See QST Feb '54." Apparently this is a mod a previous owner performed.

I looked at my library but I couldn't find that magazine. I did find a listing saying this is an article by Howard Morrison on adding a better crystal filter to the BC-312.

Anyone have access to this article? and willing to scan or copy it?

TIA,

Steve.

1690. Need help with Drake C-line problem

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-02-19 05:49:18 UTC
From: vibroplex@mindspring.com
Message-ID: <96qc4u$8cn$1@news.netmar.com>
Source record: 56200

Dear All,

I have a Drake R-4C/T-4Xc combination that I use to transceive. Sometimes, when I release the key, the receiver comes back very muted. I have removed and cleaned the relay under the chassis and the receiver and that seemed to improve things. However, it is still doing it to some degree. The effect is that when I release the key, there's a 1 in 10 chance that the receiver doesn't come back. Are replacement relays available? If not, can anyone suggest where else I might look to find where the trouble could be?

Thanks for any help you can give me,

73,

Derek

WoW! Having had my nose in the back door or a few AM and FM BC transmitters of small-market radio size I can appreciate what a job that must have been.

That RCA moniker reminds me of the early RCA videotape recorder I used to work on at WFM-TM, the educational TV station we had at Fort Monmouth. They kept me there after I finished the TV Equipment Repair course at the Signal Corps school to work in the TV station which produced training films and ran a big closed circuit TV system to every classroom in the large Army Signal school. We didn't have an on-air transmitter, just 9 channels on closed circuit which ran continuously each school day. The Video tape machine, NOT a cassete recorder by any means, was a Model TRT-1A, black and white only, no color, had an large open rackmounted headwheel assembly rotating at 15,750 RPM using 2 inch wide open-reel tape on twelve inch reels. The three heads were mounted 120 degrees apart and each head started another track as the previous head finished one.

We had to clean the three heads on the headwheel assembly after each tape pass with our fingers and a lintfree cloth bathed in Carbon Tetrachloride to remove any tape emulsion that might have been left which would cause video dropout.
The thing was in four six foot equipment racks against a wall. The video quality was poor at best, jittery and speckled with dropouts where emulsion would fall off the tapes. We had a Kinescope Recorder where we would then transfer the finished taped program to 16 MM film. Most of the training films where shown to the students via the films by playing them into "film chain" cameras since we ran 9 channels and only had two identical video tape machines, which were pretty troublesome and klutzy by comparison. At times we did run programs to classes via tape but mostly by film.

Splicing the two inch videotape was an interesting exercise. We used a splicer similar to a film splicer but sized for the two inch tape. The splice had to be made exactly on one of the vertical sync pulses which was magnetically stored in the programming on the tape. You found the sync pulse by brushing a fluid on the tape emulsion side and when the fluid dried you could see- under a magnifier- where a contrasting magnetic material in the fluid had collected and dried at the point of the sync pulse. A TINY point. Then you had to cut the pulse exactly in half and match it with the other half of the sync pulse from the other piece of tape you were splicing. If you missed, the system would lose sync and roll vertically when the playback passed that point on the tape. A rather inexact science to be sure, and loss of sync DID happen. All this took place in 1962.
Now $50 will buy a handful of VCR that, tho a throwaway cheapie, does an excellent job in full living color, and even they are obsolete. Whew!

Right now I've got a super clean, all original Hallicrafters SX28A (1940) upside down on the bench and am looking at 43 original paper-wax caps that have been leaky-warm enough to do a bit of dripping, and they gotta go, although the thing plays fine. In some places they're five layers deep, some are buried deep inside the RF cage among the numerous coils and their leads. I'm thinking I may cut the leads on some of the more difficult ones and leave them in place instead of trying to pry them out, then use small disc ceramics for replacements in there place instead of orange drops. I hope I'm still nimblefingered enough to get the thing reworked without trashing something important. I'm open to any advice.

(Sorry for the OT stuff.)

Dick

1694. FS.RACAL RA17 & RA117 Diversity Unit.

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-02-19 11:56:10 UTC
From: "radio-exports.com" <info@radio-exports.com>
Message-ID: <t922dmrm8tv8fb@corp.supernews.co.uk>
Source record: 56204

The Racal Dual Diversity Switching Unit,Type MA168,was one of the last "add-ons" (and one of the most useful) to be made by Racal, as an accessory for use with the RA17 series of receivers and RA117 receivers.
It was designed by Racal engineers to overcome the problems of signal fading.

Essentially,it is an electronic switching device, which automatically selects the greater i.f.output from two receivers fed from two different antennas.
The unit is fully transistorised,has it's own built in power supply and will operate from both American and European mains voltages.It is designed to work with ssb,cw (and rtty signals etc., up to speeds of 1000bauds).
The two signal paths through the unit can be monitored,by two meters on the front
panel.

This is a very smart,compact, 19" rack mounting Racal unit, only 1.75" high.

It has been checked, tested on air,and is in full working order.
A copy of the very comprehensive Racal manual for the unit is included.

We would highly recommend this unit,which really does a great job of bringing up fading signals.

These diversity units are quite scarce now,so here at radio-exports in the UK we are rather pleased to have secured a further three of them.

Price,which includes the cost of packing and air freight to the USA,is only $385 US Dollars.

For more information if required, or to order,please contact Graham Leo
info@radio-exports.com
Thank you for your interest and attention.

Source record: 56207

>Has anyone used one of these before? I bought one, but I don't actually
>know what it does. Tom

It is basically a VLF, MF receiver with a highly calibrated "S" meter, and switches which drop "pads" into the circuit to reduce the gain, so the incoming signal can be accurately measured. These analyzers DO NOT have AVC/AGC, so listening to a station requires adjustment of the gain settings to put the RF envelopde in the proper range so it can be demodulated. Therefore, these receivers are not suitable for listening to signals which fade or fluctuate. Also as you tune frequency to frequency, you'd have to adjust gain to get audib;e signal.
As I recall VLF section is pretty good, but filtering is not up to communiations receiver standards.
Input impedance may be an issue, too.

There should be a headphone output; try picking up local AM stations...you'll get the hang of it.

My web site www.fathauer.com has been updated with some additional collector tubes and a sale list of early receiving tubes.

1720. FS: Manual for Eddystone 770-R

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-02-19 21:23:43 UTC
From: radiomatt@aol.com
Message-ID: <20010219162343.02165.00000712@ng-bd1.aol.com>
Source record: 56230

The 770-R is the VHF 19-165 Mhz tube receiver from 1965 or thereabouts.
Original factory manual with most pages mimeographed, but printed foldout
schematics, parts layouts, parts lists and voltage test points, and amendment
sheets 1 and 2 from 1966. Gray cardboard covers show Stratton & Co as mfr.
Plastic bound; binding shot, but manual contents in good shape. If you remember
the early panic over the original Sputnik satellites, these were receivers used
to pick up the signals! (20.004 MHz, more or less)
$29 shipped Priority Mail, insured, in US. Overseas more.
EMail only please

The only problem is that R&R Designs sold their paint business as as I understand it they are no longer in business. So this Web insformation you reference is old, old, old and outdated. They sold the paint business to Radio Restorations.

Try Radio Restorations at:

Yaesu FRG-7 general coverage receiver with manual in excellent cosmetic and electrical condition. $200.00 American FIRM.

Please email him directly at: swhite@magi.com. His name is Stan White - VE3FKD.

Thank you for reading this message

1747. FS.R109 Communications Receiver.

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-02-20 11:18:46 UTC
From: "radio-exports.com" <info@radio-exports.com>
Message-ID: <t94kjg164u7v42@corp.supernews.co.uk>
Source record: 56157

The R109 Communications receiver,dating from the 1950's,is a well designed,compact equipment,made in relatively small numbers for use by the British Army.It is a communications receiver which here at radio-exports.com ,in the UK,we do not see very often.
Frequency coverage of the receiver is 2Mc's to 12Mc's and the receiver uses 8 tubes.This one is a particularly nice example, as it still has the internal pull out spares tray,(which is usually missing),containing the original set of spare valves and a spare vibrator).Externally,the receiver is in good condition and internally,near mint.
The receiver is in good working order.
The price,including the cost of packing and air freight to the USA is a very modest $328 US Dollars.

Hello!
Our Fire Department has a low band Motorola Mitrek that we would like to sell or trade.

It is a 4 channel, 110 watt, 39-50 MHz, with an extender (noise blanker) and is set up for tone squelch.

The info on the data plate is:
FCC Xmtr Data: CC1155
FCC Rcvr Data: RC0214
Model #: T81JJA4900DK
Ser #: 433HJY1476

For more information on the radio and accessories, or to see photos of the equipment, please visit:

http://www.haworthfire.com/mitrek.html

Asking $50 (plus shipping). Would be interested in trading for VHF equipment.

If you have any questions, please feel free to contact me by e-mail or phone (580-245-2446).

Thanks for your interest!
Kirk

1753. 6146B and tube tester question

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-02-20 18:30:19 UTC
From: David Fleming <davefleming@novagate.com>
Message-ID: <96ud3r$tb0$0@205.138.138.3>
Source record: 56163

I am using a Sencore "Mighty Mite" to check 6146B transmitting tubes. For the most part, they check good, but when they are left in the tester for extended periods of time, the grid leakage goes up and pegs the meter. First, is leaving the tube in the tester with the filament on a bad thing, and is it ruining the tubes?
Second, after removing from the tester, and allowing to cool down, the grid leakage current values go back to a very low amount, barely moving the meter.
Thanks for the help.
Dave, NS8S

UMMmm - not familiar with that particular brand tester, but I have noted
that on my TV7-BU, there are SOME tests on SOME tubes that include the
caution to only hold the test button down 30 seconds or less -
presumably the test procedure in those cases apply conditions/voltages
that might damage the tube.

I need a pretty long telescoping whip antenna for a project I'm working on; can't seem to find a suitable one from any of the usual sources. Should extend to at least 5 to 6 feet (the longer the better) and collapse to no more than 1 foot or so. Needs to be free-standing when fully extended. I might be able to use one from an old Transoceanic or Heathkit Mohican. Any help? Thanks.

1770. Chassis Refinishing

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-02-21 03:56:13 UTC
From: Mark Bell <bell@blazenet.net>
Message-ID: <t96f8s43rqotc6@corp.supernews.com>
Source record: 56180

I'm at the point in my 5100B restoration where the subassemblies are almost ready for remounting on the main chassis.

The main chassis was pretty cruddy (to put it mildly) and I ended up having to use extra fine steel wool over the entire chassis to remove all the grime etc. I had heard about Flitz metal polish, so I tried it on a small part of the speech modulator unit, and a small part of the main chassis. Seemed to work OK. I let them sit for about a month, and found that the metal surface was slightly cloudy. It took a lot of buffing to get those two areas shiny again, but they seem to be slightly cloudy again.

I've noticed that on the areas of the main chassis where I didn't use the Flitz, but where I buffed it out anyway (with a dremel moto-tool buffer), there are blemished on the chassis, with a very slight oily residue. As soon as I noticed the blemishes, I stopped, and figured I was using too much pony power (RPM) for the job.

So, what's the deal with the Flitz, and any suggestions on how to finish the chassis to remove the slight oily residue?

Thanks

Mark K3ZX

I have a very nice National model NC-183D general coverage receiver for sale - it comes with a copy of the manual. This radio is in very good condition inside and out - no mods, all original knobs, etc. - $345 plus s & h from Schenectady, NY

LIST OF ITEMS FOR SALE: (revised 2/20/01)
http://sdstudio.freeyellow.com/page3.html

1777. R1155L (Classic WWII Aircraft Receiver)

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-02-21 13:10:29 UTC
From: "radio-exports.com" <info@radio-exports.com>
Message-ID: <t97fgpr2ki48a0@corp.supernews.co.uk>
Source record: 56187

The R1155 British Royal Air Force,WWII receiver,as typically used on the Lancaster Bomber is undoubtedly one of the all time classic boatanchors. Finding one with all the original componets present is very hard,as most were modified after the war,typically by removing all of the direction finding components and installing an internal power supply.

The R1155 which has just come in to radio-exports.com ,is that rare find,a set which has survived in a totally original state, for over half a century. The receiver in question is a model R1155L,which has a very useful frequency coverage.Five switched bands cover the following frequencies: 200-500 kc's,600-1500 kc's,1.5-3 Mc's,3-7.5 Mc's and 7.5-18Mc's.
The receiver retains all of its engraved,screw fixed name plates;all control knobs and switches are original;the makers plate and the Ministry of Defence plate are still present and the set is fitted with the later (improved) off-set slow motion tuning drive.
The receiver is totally unmodified.
All of the direction finding components are present.
The receiver is in it's correct original aluminium case.

We have tested this receiver on air and can confirm that it is in full working order.

Included with this excellent example of a working R1155 are it's brand new,unused original Air Ministry headphones.

This is a rare opportunity for the serious collector to obtain a fine example of this desirable receiver,in full working order,with the added bonus of the new/unused headphones.
The price,including packing and Air Freight to the USA is $585 US Dollars.

If you would like more information,or wish to order,please contact Graham Leo info@radio-exports.com
Thank you for you time and interest.

1781. Drake SPR4 Tuning Knob Question

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-02-21 23:14:40 UTC
From: Gary McGill <mcgill@notes.cba.ufl.edu>
Message-ID: <3A944BE0.841F3D37@notes.cba.ufl.edu>
Source record: 56191

I just acquired an SPR4 in very nice shape. I have a question regarding the tuning knob. My problem concerns the "skirt" section of the two part knob (the knob itself and the "skirt" that is between the knob and the face plate). This skirt seems to scrape against the front panel just enough to cause it (the skirt) to move when tuning. This is worse when tuning in one direction vs the other. I don't have this problem on my R4b, where the two part tuning knob/skirt is set well back from the face plate.

Any suggestions as to cause/repair of this problem. Thanks in advance for any tips.

Gary
mcgill@ufl.edu

1782. WTB: Collins KWM-2A and pwr supply, RE

Hello and thanks for reading. I have recently retired and moved to a smaller QTH. Not quite room enough in the shack for my S-Line separates so I'd like to sell them and purchase a KWM-2A, Round Emblem, and the matching 516F-2 power supply. The units should be in VERY nice electrical and cosmetic condition. If you've got a set-up like this for sale, I'd love to hear from you.

Thanks and 73,

Pat (W7YCN)

1798. FS: Collins KW-1

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-02-22 03:15:54 UTC
From: Eugene Rippen <soundval@foothill.net>
Message-ID: <9720udqnf1@nntp.foothill.net>
Source record: 56062

The first batch of individual pictures are views
of the whole outside of the transmitter.

The second batch in " /KW-1" presents an index
of 41 closeups of sections and a few of the face.
You may select individual pictures from that index.

Collins KW-1. Pretty original except as follows.
The high voltage transformer is a brand new
Peter Dahl placed in the old original case by
Peter Dahl. The first interstage audio transformer
is not original. A relay has been replaced with a
new one. Of course, some of the tubes have
been replaced.

Looks very good. Works great. It is curently
hooked up to an antenna, through a wattmeter
for inspection.

Any packing is left up to the buyer. I presume
this weighs around 600 - 700 pounds. I will not
pack it.

I can deliver it as follows: It will probably have
both lower units removed from the rack and
transported separately, it would be transported
on its side in a heavy duty enclosed cargo trailer,
re-assembly is entirely the responsibility of the
buyer, and two strong people must be instantly
available to help unload. The price for this
delivery will be $300 plus $1.00 per mile
(charge for one direction only). Payment in full,
including any delivery charge, must be received
prior to any shipping.
If I should so deliver it, it will be solely at the risk
of loss or damage assumed by the buyer, I have
no insurance to cover such.

California SALES TAX may be due according
to law.

This is hooked up, and can be examined,
however.....
Regardless of any communications concerning
this item, I will hold it only 5 days, after a buyer
says he will buy, for payment in full (including

shipping, if requested).

I had an SPR-4 with this problem; the way I cured it was by putting a washer under the skirt, where it makes contact with the rubber spacer. I think that the rubber shrinks over the years.

Hello!

I wonder if a FT901DM is already in the BA ranks... please, forgive me if not. Press DELETE and don't be too hard with me...

I have got a KIT version. How???. Yes, a KIT. As a Heathkit but with less detailed instructions...

What I got is the covers, main chassis (with some pre-assembled parts), and a couple bags of modules, screws, small covers and other parts. Former owner, attempting to repair it (!), dismantled part of the rig and modified / charred some of the wiring :-(. Well, at least price was right (and it included SP-901 and FC-901 in standard (no KIT) form ;-))

So I _desperately_ need the 901 schematics (or, better, a complete manual). Please, let me know if you can help me on this.

Thanks!

JOSE

Argentine Communications Receiver,Model 8722A.
Here in the UK, radio-exports.com have an interesting and unusual receiver,taken as a trophy of war by British soldiers,during the war between Argentina and Britain.
It is a transistorised Communications Receiver,covering 1.5Mc's to 18Mc's in 4 switched ranges.The design incorporates Switched Selectivity,BFO,AVC, & Calibration.It has an internal speaker.
The receiver is designed to operate from 12volts DC,either from an external source or from 8 standard 1.5volt D cells,for which a battery compartment is incorporated in the set.
Apart from some very minor corrosion on the chassis in the vacinity of the battery compartment,the communication receiver is in good original condition.
A detachable front cover to protect the controls when the set is not in use,is included.
The receiver is in full working order.
This is an unusual,nicely built set,not very often encountered.It is an interesting collectors item, which can be used and enjoyed for a very modest outlay
The price,which includes the cost of packing and air freight to the USA,is just $395 US Dollars.
If you would like more information or wish to order,please contact Graham Leo info@radio-exports.com
Thank you for your time and interest.

1810. FS: Collins KWM2-A WE (CCA good)

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-02-22 18:49:21 UTC
From: Ron Manfredi <wa2eio@mindspring.com>
Message-ID: <3A955F31.E80B45DB@mindspring.com>
Source record: 56069

I have a nice user KWM2-A for sale.

This is a Factory KWM2-A (with the wide eyebrows), with plug in relays, but not the teflon wiring. The serial number engraved into the rear chassis panel is 10,702. The label on the chassis is not legible. The dates on the components
indicate probable manufacture in 1965. Has spinner type main tuning knob with scratches in the aluminum insert, cylindrical ssb filter, and the hardware to secure a PM-2 supply to it. Comes with the standard Ham band crystals in the lower sockets.
The cabinet has been repainted, color looks close, but finish is flatter

that the normal Collins paint. (a fair paint job) There is some wear on the lower edge of the front panel. I would rate this unit as CCA Good/ (fair). The feet are not original, no front risers. Chassis is dirty, but no corrosion or missing parts. It would clean up well. The antenna connector's ceramic is a bit worn, but an RCA plug makes positive contact.

This radio is working fine electrically; I can get a full 100 W output on all bands, and the receive agc action is smooth; I am not sure if the

agc mod has been done or if this unit incorporated the changes, but is does sound nice, and shows good sensitivity. All controls have been cleaned. Comes with an orginal manual in great shape. Since its overall appearance is not mint, I rate this as a good user unit, not a collectable. I would ship CONUS for $725.

73,
Ron WA2EIO

I don't know about that. I'd expect at least a few microamps of grid current from a power tube. Why do you think the tube manual reccomends such low value grid resistors for power tubes? (like 100k)

Interesting question is the polarity - negative grid current means space charge electrons trapped by the grid, postive means either cathode material plated onto the grid, or gas. Negative is normal. Maybe a voltmeter insinuated into the tube testers' socket could measure the polarity.

Source record: 56076

Hi all,

I just bought an S-22R that needs some TLC. I have seen alot of information on the S20, but very little on the S22R. I did get a schematic and alignment instructions from BAMA. But I have a few... I guess you'd call them more general questions that I'm hoping you guys can help me out with:

1. How does radio this compare to an S20? It's refered to in the doc as a "Marine" radio, I'm not sure what they mean by this. I'd appreciate any general information you can tell me about it.

2. Assuming that this radio is all re-capped and aligned, how good of a receiver is it?

3. I was going to replace the linecord and just fire it up with a variac, but looking at the age and condition of the caps I've decided to clean it up and re-cap first. What is the best type of caps to use to replace the old paper of this era? Typical values are like .01, .02, .05, all at 400v.

4. Is it a good idea to leave the cloth covered wire alone, or replace it too? That's a MUCH bigger job obviously. Most of it seems fine, there is one twisted pair that brings the 110vac to the front panel that looks a bit shakey so I'll probably replace that for good measure.

5. What is the best cleaner to use on the chassis?

6. I'm going to take ALOT of digital pictures right from the start to document what I had, and what I did. I also will take alot of notes. Any other suggestion or ?? before I dig in and start?

Thanks so much for your input.

73,

Mark W1EOF

1818. Noise Performance of Early VHF Tubes?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-02-22 23:55:56 UTC
From: jwiel@world.std.com
Message-ID: <G96nt8.HBC@world.std.com>
Source record: 56077

I've been wondering what the noise performance of early VHF designs was. I can't find any noise data for tubes of the 6AK5/6AG5 or 12AT7 vintage.

The closest I can find is a reference in a GE data sheet for the 6BK7. They claim a 7 dB noise figure for a cascode with a good input impedence match to 300 ohms.

That works out to an equivalent input noise of .316 uV for a 4 kHz bandwidth narrow band FM receiver, and 1.58 uV for a 100,000 Khz bandwidth wideband FM receiver. Which ain't bad. (assuming that the RF amp had enough gain to overcome the mixer noise, and that the IF could limit on the signal, and had no significant noise of its own. I don't know if these are valid assumptions for 1940's technology)

Anybody have any hard data for the older tubes?

I was drafted in 1972, and was told that I was going to drive a truck,
or become a cook. I told them that if I was a truck drive, there would
be accidents, and if I was a cook, a lot of people would be sick. The
sergeant gave me a dirty look and asked, Just what the hell CAN you do?
I smiled and told him I was one of the best Electronics Tech's he'd ever
meet, and he started laughing and told me there was no way in hell, that
I knew anything, and to prove it, I was given the test for 26T20
(Broadcast Engineer), and got the highest score on record at Ft Knox.,
then I was awarded the 26T20 as a civilian acquired skill. I ended up
in Alaska at Ft. Greely working at an AFRTS station, first built in
1948. Lots of boat anchors. All three transmitters, one of the audio
consoles, and one of the old Level Devil audio compressors. It ran 24/7
with only 6 hours a year scheduled downtime. The AM station used a
Gates BC250 on 980 KHz, and several gates VHF TV transmitters on Ch 8.
Quite an experience.

Mark , I may be able to answer some of your questions, the S20 covers .54khz to 44 mhz .it is 120vac .the S22R came out in 1940 covers 110khz to 18mhz. it was to operate on 120 or 240 volts. the overall performance would be comparable .. actually they were unstable ,noisy ,drifted all over etc...but...that was state of the art in 1938 /39/40 era. it will be fun to recondition one and make it play.. have fun 73 Harold W4PQW

Just realized that I never turn on my yaesu FT-840 anymore. Always operating the boat anchor stations. The radio is in perfect working condition and has narrow CW and wide AM filters added. (no FM board... sorry). has a couple scratched on top of the case, otherwise mint.

Will trade for complete boat anchor station or a couple GOOD hallicrafter /hammarlund / what ever receivers. Use your imaginagion, get this tubeless hunk of crap out of my shack!!!

REAL RADIOS GLOW IN THE DARK (And they operate on CW)

By the way, I am in North west part of North Carolina if gear pickup is possible. Glad to let you hear it on the air if you wish.

>Anybody have any hard data for the older tubes?
>
It would also be interesting to look at the 9xx acorn from the mid '30s and
the 9xxx 7 pin miniatures they evolved into. I don't have my books here, but
IIRC, the 954 became the 9001 and improved into the 6AK5. Looking at the
'guts' of a 954, it is rather remarkable for that period that they had shrunk
the 58 into the 6K7 and then to the 954 in only about 12 to 18 months.
Sylvania also made some really small VHF tubes in the late '30s by putting
tiny assemblies between the pins of loctal envelopes. When you look at them
they look empty until you realize that the 'works' is laying sideways betwixt
the pins inside the base shell area.

1834. FS: Central Electronics 100-V

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-02-23 17:32:05 UTC
From: jpevner@aol.com
Message-ID: <20010223123205.19459.00002800@ng-mp1.aol.com>
Source record: 56093

Cosmetics:

Very good face, ok cabinet, standard chassis spotting (esp near where the bias batteries were). I have cleaned the rig pretty thoroughly.

Functionality:

Some CW output on all bands, the couplers are present and OK, the VFO is fine. The limiter board was damaged by battery acid. I have the old one, and the new PC board from Nick Tusa (which would need to be populated). The PS seems to be fine.

A buyer would probably need to replace the chemtronics caps, put in matched diodes, full alignment etc.

I will include manual.

Buyer must pay via money order/ cashiers check & pay actual cost of shipping from 01518 (Central MA).

I will include a new set of matched finals for an extra $50. I think the current finals are OK, but the low power is a problem in the overcurrrent relay tripping too soon.

regards,

Jon N1LIS

Source record: 56115

Here in the UK,at radio-exports.com we have a useful accessory for owners of Racal RA17 and RA117 Receivers,namely, a Racal Pre-Selector/Protector Unit Type MA197.

This accessory was designed by Racal to achieve two objectives:-

Firstly,to bring about a considerable improvement in the front -end selectivity of the RA17 and Ra117 receivers, by introducing a high degree of pre-selection.
In real terms,the use of this unit will result in a nearby signal (5% off tune) being attenuated by 80dB's, in the range of 2-24Mc's.A most effective way of sharpening the performance of the RA17series and RA117 receivers.

Secondly,use of this unit solves the problem of operating any receiver (not just RA17 and RA117 receivers), in the vacinity of high-power transmitters.It will effectively protect receivers from front end damage or even burn out,since it will withstand r.f. signals of up to an incredible 40 volts!

The unit is designed for standard 19" rack mounting.Operation is from either 100-125 volts or 200-250 volts.
It is in good ,original,unmodified condition.We have tested it on air and it is in full working order.

The price for this most useful Racal accessory,which includes the cost of packing and air freight to the USA is $480 US Dollars.

If you would like more information or wish to order,please contact Graham Leo info@radio-exports.com

Thank you for your time and interest.

Hello All

Does anyone have (or can anyone point me in the right direction to) info
and/or schematics for the Codar CR-70A?
If it it exists in the same void as the Murphy B40 receivers then this won't
be easy

many thanks in anticipation

I always find it interesting that a person with these credentials would sell equipment like this untested. I usually infer that he probably tested it, and it was BROKE! So he sells it as untested as is, too bad for the buyer.

FS: I have a stack of original test equipment manufacturer catalogs that might be helpful to hams that mess with this stuff. I'm not sure what they are worth but will entertain offers for the entire lot. They are as follows: HP-(years)70, 72, 73, 88, 91, 94....Tektronix- (years) 69, 71, 73, 74, 76, 87, 88, 89....Fluke-(years) 86, 88, 91....Wavetek-90... I have had these for years and don't use them anymore. If you are interested I'd be willing to trade or sell.... Mike (979) 693-1461.

re: "I always find it interesting that a person with these credentials would sell equipment like this untested. I usually infer that he probably tested it, and it was BROKE! So he sells it as untested as is, too bad for the buyer"

Why is that interesting? The guy is in business, and this piece of hardware isn't worth a lot of bench time. It's ham radio equipment, so I would assume the bidder can either do repairs, or has a friend who can. If that isn't the case, one should not bid on un-tested equipment. There are a lot of good, repairable boatanchors out there, that don't work.

Don

1867. KWM-2, 30L-1, 312B-4 Learning Manual

Message-ID: <3A980EC5.EEB2EBD3@my-deja.com>
Source record: 56127

If you are a KWM-2 owner you may be interested in a copy of a manual
that I found some time ago.

It's great for those who aren't used to operating and using vacuum tube
gear and has a complete sequence of lessons on how to connect and
operate the KWM-2 and also the interconnection and use of it with the
30L-1 amplifier and 312B-4 Station Control if you also have those items.

$7.50 postpaid if you're interested.

For more details and an example of a page see:
KWM-2 Learning Manual

1875. Johnson Ranger advice needed - HELP!

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-02-24 23:37:59 UTC
From: w7ycn@aol.com
Message-ID: <20010224183759.02970.00002367@ng-fx1.aol.com>
Source record: 56135

Hello - and thanks for reading. I'm not much of a technician but I'd dearly love to get my Ranger back on the air. Trouble is that it blows a fuse everytime I turn the power switch to the Tune position. The manual states that in such a situation one should remove the exciter plug from the back and test the resistance between pins 5 and 6 to ground in the power off position. It says the resistance should be "many megohms". I did as instructed and find the resistance to be about 12K. But even a non-techie like me can look at the schematic and see that that is about right. Am I reading the schematic incorrectly or did Johnson just get it wrong? I'm looking at two schematics: one dated 10/17/57 and the other dated 3/16/65. I just don't see how the resistance could be "many megohms". I would be most grateful for any suggestions you might have. Thanks and 73. Pat (W7YCN)

Such attenuators do exist. I have in the shack a 0-100 dB attenuator in 1 dB steps. It was manufactured by Pascall, UK, about 5 years back. I forget the price but it was quite expensive. Don't know whether the firm still exists. Built into a solid die-cast aluminium-alloy box.

Cable leakage does not increase with frequency - it decreases. Worst of all at DC and audio frequencies. Leakage occurs mostly at connectors. Use threaded types, not simple plug and socket. Impedance mismatch at connectors is no problem with attenuation measurements.

I have made measurements up to 160 dB at up to 5 MHz by comparison with variable attenuators. A 10 watt signal generator is needed. Without any extraordinary precautions it is possible to make measurements with an uncertainty of a few tenths of a decibel at 100 dB.

I have also made measurements with a precision of 0.001 decibels at frequencies up to 10 MHz. Such measurements are necessary to determining the loss vs temperature coefficients of components and systems when it is possible to vary the temperature only a few degrees C. A high precision is also needed when calibrating field attenuators against laboratory standards.

Pat - and others working on the good stuff... -

First - REMOVE ALL THE TUBES and try it again. IF it blows a fuse then you know it is NOT a tube. -OR- If it doesn't - then one of the tubes is shorted. Check the tubes with a tube tester.

Second - If not a tube then do VOLTAGE CHECK. Your manual has a list of all the sockets and the Voltage to each pin. Take Voltmeter with Neg (Black) to chassis ground and check each pin. Voltages will not be exact. So anything + or - 15% is normal. If that's OK then go to next step...

Third - UNPLUG Ranger from wall socket and do resistance checks on tube sockets. Again, your manual has a list of what resistances should be.

ONE OF THESE STEPS SHOULD POINT TO THE PROBLEM!

The 100s don't bring near that much, but I have seen them top out around
$500 for a really nice one.

The only Hallicrafters rigs of that era that i've seen bring big prices are
the SX-115, FPM200, and the SR-2000.
I did see a mint, so called "collector quality" SX101A make near $800, but
I've not seen any others that high.

Currently the prices are sliding for anything except the rare and really
nice stuff. Lots of stuff hasn't been making minimum bids, or reserve
prices lately.

I think the stock market is drying up a lot of that spare cash.

I guess that it must be quite expensive if you really get such
accuracy as you later claim, even in a controlled constant
temperature.

I also suspect that the VHF/UHF performance is not that spectacular
and since the original poster did not specify the required frequency
range, I originally asked about it.

>Cable leakage does not increase with frequency - it decreases.
>Worst of all at DC and audio frequencies. Leakage occurs mostly at
>connectors. Use threaded types, not simple plug and socket.

DC and audio circuits generally have a much higher impedance levels
than 50 or 75 ohms used in RF circuits, so the capacitive coupling is
a much worse problem. At very low frequencies the coaxial cable does
not work properly as a transmission line, thus the isolation is not
very good. However, due to losses at very high frequencies, the shield
no longer act as a perfect conductor and you can get different
currents flowing on the inside and outside of the shield.

>I have also made measurements with a precision of 0.001 decibels at
>frequencies up to 10 MHz.

I guess that must be the readout resolution in some comparative
measurements but not an actual precision. A 0.001 dB voltage ratio is
115 ppm (0.015 %), so I wonder how this accuracy could be maintained,
especially if some real power levels are involved heating the
attenuator.

Absolute accuracy should not be confused with precision.

To measure attenuation within "a few tenths of a dB" (at any attenuation level) entails detecting a difference between two voltages which are a few percent different from each other. This is an easy job for any voltmeter. Errors are not due to the comparing voltmeter but to the measuring components, cables, connectors and layout.

Accuracy entails comparison with a local standard. There will be uncertainty in the local standard in addition to errors introduced during the comparison process. There will also be uncertainties introduced at each calibration level up to the International standard.

Precision is related only to local effects such as signal to noise ratios. It is relatively easy to detect a difference of 10 microvolts between two voltages of about 1 volt each. This corresponds to a precision better than +/- 0.0001 dB

I see you're an expert on me and my life. I've never met you, but you seem to have a fetish for me. Please stay away, I really just go for women. You have NO idea how busy I am and what I CHOOSE to look at further and what I don't. I am a serious collector and have to go through many pieces of equipment (bought as a lot) just to get that ONE piece or accessory I need for my collection.

If it's expensive and worth my time I may test and look into it further. But as with all older electronics (as ANY experienced electronics technician knows) you don't just "plug it in and fire it up". The proper way to reform electrolytic capacitors and make sure there are no power supply problems is over DAYS, SLOWLY with a variac. This amplifier is not likely to go for enough money to make this worth my while.

What's your REAL problem?
Jealousy?

>Paul OH3LWR
>

Hi Paul,

Precision, Resolution. These can be the same thing or different;
however neither are a statement of accuracy.

When my old Drake TR-7 VFO gets buggy, I might note some one at
47.1652 MHz and smile at the precision of that reading, and yet it is
off by 40 MHz (an errant 4 is showing). Lots of precision, lots of
error.

However, as your question lies dormant:
> I wonder how this accuracy could be maintained,
>especially if some real power levels are involved heating the
>attenuator.
which is a concern shared by any metrologist. The load is the
defining point of a power measurement. The load must be known and
with power applied - it changes.

The first, and simplest, solution is to over engineer the load's
ability to "DISSIPATE" energy. (sorry to scream in your ear, but
others here needed to hear that) That would suggest using a 100W
continuous service Dummy Load to measure 10W period limited power
measurements. Or simply measure the load under the power applied.

Attenuators, on the other hand, are not 100W and few are 10W devices.
Most are on the order of 0.1-5W. So, I presume you wonder how to get
one of these into the signal path of a 100W rig? You use a
directional coupler to tap a portion of the power (and you need to
know the portion, but accurate determinations are fairly simple) and

feed that tap through the attenuator and add the coupling loss (or that portion) to make a total.

In short, you have a 100W Source, a 100W Load, a 20 dB Directional coupler, a variable attenuator, an attenuator Load (how many miss this one?) and a detector. You can now read applied power at a 1W level instead of the 100W level. And you can measure the variation from that level with reference to your 100W reading to the resolution of the detector. Resolution or precision could run quite high. A measurements of change would also find high "relative" accuracy.

Relative accuracy means you do not need to know where you are, or where you started in absolute terms, merely how far apart they are. There is an interesting implication here in this subject. As we are interested in attenuation, any measurement of an attenuator is both "relatively" and "absolutely" accurate. This is one of Gary Peach's link pins to the absolute measure of received power.

Have a 2K-4A in excellent condition and fully FACTORY CHECKED out. Uses a pair of 3-500Z tubes on 80-10M including the WARC bands. Console model, weighs about 150 pounds.

I can ship ANYWHERE in the world. Professionally packed and shipped from the Henry docks. This amplifier has just been gone through and given a clean bill of health by HENRY factory technicians on 2-23-01. FULL output. It is currently at Henry Radio amplifier factory right now. A new Henry that is comparable costs $2550 + ship.

$950 + packing/shipping

Station Radio C13 HF Transmitter/Receiver.
Finely engineered,first quality British Military Transceiving Station.

This installation, which is in stock at radio-exports.com,is the complete radio station outfit.
Frequency coverage is 1.5Mc's to 12Mc's on RT and CW.
Maximum Power Output 30 Watts.

The station is comprised of the following units:-
Transmitter/Receiver
24 volt dc input Power Supply,
ATU,
Antenna Base
Junction Box and Operators Control Box
Headset (headphones +mic.),and Morse Key
Full set of interconnecting Plugs and Cables,dc Input Cables and a remote Antenna Cable.
Two, correct, Steel Mounting Trays onto which the various units can be secured,in order that the station can be moved as a single unit.
The original user handbook.

The condition of this equipment is excellent,in fact the best example we have seen.
It is in good working order.
If you are a serious collector of military sets and want only the best examples,then this particular C13 Transmitter/Receiver Station is most certainly the one for you.
.
The price for the whole station,including packing and air freight to the USA,is $895 US Dollars.

For more information or to order,please contact Graham Leo
info@radio-exports.com

Thank you for your interest and time

1957. FS: WW-II ARC-5 Receiver BC-946-B *Original*

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-02-26 12:29:55 UTC
From: mc@sover.net
Message-ID: <3a9a4c34.4948241@news.sover.net>
Source record: 55966

This is a nice completely original BC-946-B ARC-5 Command Receiver
that covers from 520 to 1500 Kilocycles which is the AM Broadcast
Band. It was made by the Colonial Radio Corp of Buffalo NY. It is
totally original and has the FT-310A adapter installed. It does not
have the Dynamotor installed but the mounting pins and plugs are
intact. Command receivers covering the Broadcast Band are very
scarce.

I am asking $100.00 plus shipping for this item. If interested please
reply by e-mail.

Cordially,

Michael Crestohl
mc@sover.net

I had a circular dial from a different radio that I has able to
heat up in almost boiling water, then flatten it quickly on the
counter. You'd hafta be sure that the dial markings are not
gonna wash off, preferably in advance of trying it.

I have an old ZEOS Notebook 386 that developed dead batteries when I did not keep them on trickle charge. I carefully cut one of the 2 open and found that the batteries were standard 1700 mah cells that can be be obtained from various nicad sources and soldered together. I can sometimes restore the batteries if not hard shorted by zapping them, but zapped batteries never perform well after zapping, and must be kept on constant trickle charge as you can see from my webpage at http://www.ultimatecharger.com

1988. Question: New AM FIlter Heath SB-303

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-02-27 00:50:42 UTC
From: Larry W9MDX <net1@netohio.com>
Message-ID: <CRCm6.309$DF3.28410@newsread1.prod.itd.earthlink.net>
Source record: 55847

Guys:

I recently purchased a Heath SB-303 Receiver. It is a very nice receiver. It is sensitive, extremely stable, and with a few tricks the dial mechanism is as smooth as many Collins dial mechanisms. I noticed that the AM filter was effective but quite narrow (3.75 Khz). Most AM filters are 5 or 6 khz and as a result the AM filter in the SB-303 restricted some of the fidelity that is available on some of todays AM signals.

There is a filter manufacturer (well known in filter circles) that would be willing to make a 5 or 6 khz filter for the radio but the minimum quantity would be 10. At slightly over a hundred dollars each, I would be willing to pay that for one but I am not sure that if I stuck my neck out (bought ten of the puppies), that nine other people might also want one and be willing to pay that price. I have seen the current 3.75 khz filters go for at least that on the used market because there are a lot of SB-303's out there and the AM filters from Heath were options and are not in all of the SB-303 receivers.

I would appreciate your comments. I will tell you that if I can get a committment for a fair portion of that 10, I will go ahead and order them and speculate that I could get rid of the rest. Please email me with your comments:

w9mdx@netohio.com

Thanks,
Larry W9MDX

Hi Guys;
I have a bunch of brand new "Gates" brand 1300mah Sub "C" nicad cells, they come with No markings(except code) but are from a major NiCad battery supplier and he uses
them in his packs.
You can string them for a nice Nicad DC power pack for QRP work or anything for that matter, they can be used in some portable flaslights, drills, etc.
Price is $17 for 12 shipped Priority.

I need two pieces each of Amphenol Series 26 24-pin mating connectors to
repair plug-ins for an old HP Spectrum Analyzer. the part numbers are
26-4101-24P and 26-4501-24S. Chances are that I could use parts with
some
variation in the middle number (4x01?) provided that they are mating
pairs of
Amphenol Series 26 connectors. I will appreciate any leads you might
furnish.
Please copy to my e-mail address which is <mycall at arrl dot net>
Thanks!

Source record: 55862

This is a drug store type tube tester, in a grey cabinet with shelves.
it has 46 tube sockets and is made by the Mercury Electronics
Corporation.

This is a nice simple tester, there aren't many parts inside it, I
would like to be able to use it but without the chart for the 201
model tester, I am stuck.

If anyone has one, or knows where I might find this particular chart I
would really appreciate it .

2003. FS Marine Distress TX/RX (Lifeboat Radio)

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-02-27 09:39:54 UTC
From: "radio-exports.com" <info@radio-exports.com>
Message-ID: <t9mtfla829qe83@corp.supernews.co.uk>
Source record: 55863

Lifeboat Radio Marinetta Type TRP1

This unusual,high quality set,is a special purpose MarineDistress Transmitter/Receiver,
made by Skanti in Denmark.
It is designed to operate on a choice of three International Distress Frequencies,
namely,8364 kHz, 2182 kHz & 500kHz.
The equipment has an input for operation from a 24volts d.c. boat supply.

More significantly, can be operated entirely independently by a built in hand cranked generator, (single detachable crank included),for use by misfortunate sailors when cast adrift in lifeboats, following a disaster at sea.

Controls include band switching,transmit/receive switch,transmitter tune,receiver tune and receiver volume.
The unit will send and receive both voice and cw.
It is fitted with a fully automatic morse alarm sender,and also has a morse key for sending messages by hand.
It comes complete with the correct original microphone and headphones.
Full instructions are fixed to the inside of the lid of the totally waterproof floatation case in which the transmitter/receiver is housed
.
This is a nice piece of unusual maritime radio equipment ,from an age when things were built both to last and to be reliable.An important consideration, if you found yourself shipwrecked and your survival depended on the radio working.

An attractive item for the specialist collector of Marine Radios.
Price,including the cost of packing and air freight to the USA is only $335 US Dollars.

For more information or to order,please contact Graham Leo

2009. Re: Newby needs help

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-02-28 00:15:41 UTC
From: W4NTI <w4nti@nospammindspring.com>
Message-ID: <97hfv3qcf1@slb1.atl.mindspring.net>
Source record: 55870

It depends on the current drawn through the resistor by the circuit. So the answer is not easy.

As a guess I would say that since you have such a high value it is in a low / medium current circuit.

If you have NO IDEA what the original was try 2 watts and hope.

I'd say its in the grid of a tube. Thus a 1/2 to 1 watt will do.

Can you see any of the original left? Give me a size and is it carbon or what?

Dan/W4NTI

From: Jim <jmullen@rockys.com>
Message-ID: <3a9c4b29_2@news5.newsfeeds.com>
Source record: 55871

Subject says it all. I'm looking for a small power transformer. Needs the following:

250 - 0 - 250 VAC @ 50 to 70ma
6.3 VAC @ resonable amount.

Could use anything between 225 and 300 I would guess in this circuit. (don't ask, it's for a Hammond organ, not a BA!). Form factor not important, lots of room on chassis.

Thanks,

Jim, KK1W

Hi,
I had one of those and when I sold it, I was very glad that the buyer was close enough for pick-up. They are a gold plated bitch to box up and send. If double boxed, the package is huge. If you can find a place that does foam-in-place packing, the cost of shipping skyrockets. The set weighs in at 75 lbs all by itself.
rgds,
Mark S.

Mark:
Good point. I tried to bid on one on Ebay last week that was close enough to pick up (couple of hours drive) but the seller backed out of the auction (nice huh?) because he found an buyer outside of Ebay who offered a wad for the receiver. It seem like everyone I find is one the wrong coast.

Without restating a whole explanation of ohms law (which you
should read up on), I know the radio and you can easily use a 1/2
watter here, probably even a 1/4 watter.

In all honesty, you will probably never find a service manual for that piece
of equipment. The manufacturer doesn't want the public to have them. I'm
going through the crap with APC. Good luck.

RE: "What determines the wattage required for resistors"

The current through the resistor and the voltage drop across the resistor.

You don't say if the resistor is in a control grid circuit or a B+ circuit. Worse case is, assume it is directly connected between 250 Volts and Ground. I=E/R tells us the current will be 000053 Amps. The dissipated power is expressed most simply by P=I^2 x R. So the dissipated power will be .0133 Watts. A 1/4 Watt resistor will do.

Don

Yes, its postive ground.
The complete manual and schematic is downloadable in pdf format at
http://member.newsguy.com/~p0lez1/r500/r3000sm.pdf Its a large
file and takes a while to load.

Hello. I have a very good condition clean HW-7 (no mods) and matching power supply, no manual (I have it just can't find it at the moment), Ham key, Murdock headphones and a HW-7 parts unit (Good VFO cap. and front panel, no top cover.) for trade for a VGC HW-12A, 22A or 32A with NO MODS. My first choice is a HW-12A, 2nd 32A, 3rd 22A. I will be able to supply pictures upon request. Please respond off list.

Thank you,
Randy KB8ASO.

p.s. I will consider a HW-12 (Non A version) if it is near mint.

Hello all,

since the end of February the database of radio-portal contains more than
25.000 hobby related links for SWLs and radio amateurs. I take this
opportunity for a short notice. :-)
If you have not tried the various search options before, click on "FAQ" for
an explanation.

As a special service for newcomers there is a separate search option for
hundreds of radio related FAQs:
http://www.radio-portal.org/elmer.html

2043. Military Radio help

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-03-01 01:21:25 UTC
From: Larry Menzel <retire@rconnect.com>
Message-ID: <puhn6.76$X73.17988@news7.onvoy.net>
Source record: 55803

Fellow BA addicts:

I recently found an old military transmitter, a BC645-A, in a garage sale situation. The case is a bit knocked up, but the clasps are fine.

The face of the radio is quite good, exept that the spinner knob for the internal roller inductor is broken.

Internally, the radio is a work of art. All the tubes, including a few spares are there, as are all the tuning mechanisms. The radio was set up to work from 3800 to 5800 KC. A beautiful antenna tuner, crystal clear tubes and nice wiring.

Question: Does it have any value to any of you? No power supply, and no receiver, however. Please reply personally to n0xb@arrl.net

Thanks.

Larry, N0XB
Northfield, MN

2047. FS: Lafayette99-2502 BFO VERRRY RARE!

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-03-01 04:45:11 UTC
From: skydive@mailandnews.com
Message-ID: <3a9dd225.295652432@nntp.skybest.com>
Source record: 55808

Near Mint Lafayette BFO (No, not VFO... BFO Beat frequency Oscillator) Connects to antenna terminal of receiver and generates a signal from 3.5 to 4.0 Mhz with tuning, fine tuning and level controls. Great for copying CW or SSB on radios without BFO or to suppliment defective internal BFO (I was using it with my HQ-129X until I finally got around to fixing the receiver.) Runs on internal 9V battery. Can E-Mail pictures looks and works like new. $50 + shipping.

From: jphipps@aztec.asu.edu
Message-ID: <97kk4r$q1r$1@news.asu.edu>
Source record: 55807

I have one of these; don't know whether it's a boatanchor or not (it's certainly heavy enough for one......) but it's excellent for testing discrete devices (diodes, BJT's, MOSFETS, etc.) With a bit of imagination it could be adapted to evaluation of vacuum tubes. I haven't used it in several years; it was working fine then. I don't have a manual for it nor are there any of the ancillary attachments such as the High Current Adapter.

I don't expect to be using it; any offers? I'm in Phoenix, AZ and am not too interested in shipping it anywhere.

Probably best to reply by email; I don't monitor this newsgroup too often.

2049. FS: Lafayette HA-90 VFO (fairly rare)

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-03-01 04:49:47 UTC
From: skydive@mailandnews.com
Message-ID: <3a9dd3de.296092953@nntp.skybest.com>
Source record: 55809

Very good condition, a couple paint chips and some sort of stain that looks a bit like 30 year old Pepsi drippings. All new tubes. Runs on internal AC suppply. 80 - 10 meters (No WARC) I cleaned up a bil of rust on the rear of the chassis and calibrated the thing. Been using it with an Adventurer transmitter and it works great. Can E-mail photos.$65.00 plus shipping.

house?

Lord! yah should see the ham shack here is the house. IT's was a *small*
kids bedroom in an earlier incarnation, or was designed as such. you know
the kind, where you can just walk around two sides of the bed? If I drop a
screwdriver in here, I might as well go out and purchase another as I'm not
likely to find it.

I have 4 big bookcases, a computer desk, and an office desk.
There are three computers, two 19" and one 17" monitor, an ISDN router, 5
port hub, speakers for each computer, two scanners (film and flatbed), Large
color printer, one force feedback joystick, plus my HF, VHF, and UHF
stations including two big amps.

I have to climb over stuff just to get to my chair.

The shop (28 X 40) is for the antique stations and a bit of
experimentation...The Hallicrafter rigs(currently have 3 SX 101s and two
HT32s) go out there as soon as the floor painting is finished and the work
benches are installed.

Nah, If I had the room to put it in here she'd let me. Besides she's a ham
too (General class for about the last 14-15 years.)

Tower project http://www.rogerhalstead.com/tower.htm.
Project for shop http://www.rogerhalstead.com/glasair.htm
Building 300 MPH plus aerobatic hotrod.
I flew one over at the EAA fly-in for nearly an hour some years back Man,
what a plane!

I suffer not, for lack of things to work on. <:-))

2063. Somthing new, no more Money Order's cashing.

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-03-01 23:59:50 UTC
From: Joe <joeamp@mindspring.com>
Message-ID: <97mngrooa1@slb5.atl.mindspring.net>
Source record: 55824

A recent law In New York has given agents 100% choice to cash money orders and bank checks
order's to protect themselves, "now they are ALL taking the cash and refusing to honor them"
I prefer to cash and mail at the same time, same place (The Post Office)
So now I clearly state to all replies:
Payment by ****United States Post Office issued Money Order only*****
What could I be doing wrong ?
This week, besides all the penny bickering and bitching over shipping costs (that I have no control over)
and trying to chisel the cost down to nothing possibly to pimp on Ebay (mostly buyers from CA)
1- "Joe, I got that postal money order out today"
2- Money order left
3 Sent payment this morning Joe
4 Sorry Joe I have no time to stand in line at the Post office. (Hell...I must to mail your stuff)
5-Went to the bank and took care of it this morning Joe

Guess what arrives....
3 nickel and dime store issued Western Union (Integrated Payment Systems) "the worst"
1 personal check
1-US Post Office Money order
1 strange looking certificate in Mexican or something with cactus plants, reptiles, dogs and roadrunners
(my favorite so far) Sent that guy his stuff.....and framing that one

My bank as well as the local Western Union agent (now Integrated Payment Systems Of Colorado)
In New York/Long Island will not cash any non branch issued MO, bank checks under and circumstances.
Yet merchants will accept cash can sell this Western Union toilet paper everywhere.

Easy solution I am going to donate to the school and throw the rest in the dump !

Hi All,
I am in the process of restoring a Johnson Viking Ranger II. My qiestion, does anyone have any information, mods, web pages, help, advice, etc.., you can pass on? Also, any information about parts, replacement dials, etc.

Thanks,
Jeff W8CQ

2070. New mail list is up: Novice-Rigs at QTH.net! Come on and join!

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-03-02 04:39:32 UTC
From: Dave WB7AWK <Newsgroups@boatanchors.com>
Message-ID: <uxFn6.4980$aH2.608581@news.uswest.net>

Hello all,

A new list is up at QTH.net - Novice-Rigs - devoted to all the old
Novice gear of the past. Buy, sell, discuss, shack photos, recreations,
or folks new to old gear wanting to find out more about the rigs
of yesteryear!

Rigs like:

Conar Twins (my faves!)
Heathkit DX-60 / HR-10
Drake 2C / 2B
Globe Scout 640
Ameco AC-1

and all those other 'little' rigs that Novices of old put on the
air.

If any of that is of interest, come join the group!

To join just send an email to: majordomo@qth.net
No need for a subject
In the message body enter: subscribe Novice-Rigs <your email address>

That's it! Hope to see you there for lots of discussions, sales and yakking
about the old Novice rigs!

Best regards,

Dave WB7AWK

2073. Johnson Adventurer meter question

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-03-02 12:13:44 UTC
From: skydive@mailandnews.com
Message-ID: <3a9f8d75.409157561@nntp.skybest.com>
Source record: 55833

I've been running an adventurer for the last couple years, and just discovered that it has a meter that nobody seems to ever have seen on one before. Not the normal square. It is an E.F. Johnson meter with the same scales as the square meter, and there is a gray trim piece behind the meter that seems to adapt it to the panel. Did Johnson make any like this ? If not, what gear does the meter normally go to?

See picture at:

2076. Re: Johnson Adventurer meter question

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-03-02 14:36:24 UTC
From: Lamb <k7fm@teleport.com>
Message-ID: <g7On6.637$OS1.595233@nntp2.onemain.com>
Source record: 55836

Hi:

It appears to be a Japanese meter made by Calectro that simply has a dial plate home brewed by someone with the Johnson logo. I do stuff like that all the time.

It will probably detract to a Johnson collector - but it is quieter and if you are satisfied, that is the key.

73, Colin K7FM

HAMFEST March 4, 2001 - Lindenhurst, LI

GREAT SOUTH BAY AMATEUR RADIO CLUB and SUFFOLK COUNTY RADIO CLUB
ARRL APPROVED LONG ISLAND HAMFEST - March 4, 2001

LINDENHURST, LI - NY

On March 4, 2001 the Great South Bay Amateur Radio Club will again sponsor an indoor Hamfest-Computer Show. The location will be at the:

Knights of Columbus
400 South Broadway, Lindenhurst, NY.
This is an ARRL approved Hamfest.

There will be radio equipment, electronic components, computers and accessories, software, books, technical manuals, ARRL information, Amateur Radio License Exams, Door Prizes.

Advanced registration is $18.00 each table. Tables at the door are $25.00 each. Contact Walter Wenzel KA2RGI at 631 957-0218 for table reservations. NO TABLES WILL BE RESERVED WITHOUT PRIOR PAYMENT due to the space available.

General admission is $ 6.00. Wife's and children under 12 admitted with no charge.

VE - ARRL - 12:00 NOON at Babylon Town Hall, 200 E Sunrise Hwy, Lindenhurst. For exam candidates please remember to bring your original FCC Amateur Radio license (if licensed), any C.S.C.E. forms that are pending, plus a photocopy of each, pens, calculator, formal form of ID (preferably photo ID), and the examination fee, to the exam session. Current ARRL/VEC fee is $10.00, exact change is appreciated.

Talk-in will be via GSBARC Repeater on 146.685 -600 136.5 PL.

Food Service during the Hamfest will be provided by members of the Knights of Columbus Council.

Information is also available during the GSBARC 2 meter info net every Monday evening at 7:00 PM following the Newsline Report on the W2GSB repeater, 146.685 -600 136.5 PL required. You may also write to:

Bob,

That has a VERY strong resemblance to a "Calectro" meter movement as either once sold by Radio Shack, or STILL sold by them. It could be that the original movement died and was "very" nicely replaced by the different movement. The face is very good.

I can send you a "gif" file scan of an advertisement for the Adventurer is you wish. it is about 285K in size.

Bob

2081. FT: Collins S-line

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-03-02 22:59:15 UTC
From: gspubl@tca.net
Message-ID: <3aa02599.172355874@news.tamu.edu>
Source record: 55841

I want to trade my Collins S-line for a Tentec Omni VI Pro. I will
entertain monitary offers but I
specifically want the Tentec Omni VI Pro. If you want a beautiful
S-Line and you don't have the Omni (or
know someone who has one for sale) check with Tentec.com online and
see if a used one is available. I
have a near mint Collins S-Line to trade: 75S-3B receiver (late),
32-3 transmitter, 312B-4
wattmeter/phone patch/speaker console, 516F-2 matching supply in
cabinet...all winged emblem. I am
the second owner and have all original manuals (in individual file
folders as the original owner kept them)
as well as all the receipts of its original purchase correspondence
with bids from 3 vendors, all factory
correspondence. All units have just been sent out within the last
year and professionally re-aligned and
updated with the latest factory mods to bring them back to the
factory spec. I'll trade it off for a
TenTec Omni-VI Plus. If you are contemplating getting in to
Collins' greatest equipment, this is a turn
key way to do it. I would never be without my original S-line that
I have owned 20+ years (not for sale)
but this is my backup station and trading it off is the only way I
can justify theTentec. ....

2083. Tube type power supply trainer unit f/s

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-03-03 00:25:19 UTC
From: "W. Worley" <worley@snowhill.com>
Message-ID: <3AA03963.EA8CF0CE@snowhill.com>
Source record: 55843

I have several old Army surplus custom made tube-type training power supplies. These contain several useful parts (including the case) for making a 50 or 100 W RF amp or transmitter out of. Total size is 19" W x 15" D (counting the 3" handles on the front) and 8" H. Total weight is 24 lbs. The front has two nice large 4" x 4-1/2" rectangular Simpson panel meters, a 500 V and a 300 mA. Also has a 3-pos rotary sw and 3 pots, all with nice black knobs, and a fuse holder & rocker power switch .Inside is a big plate/filament transformer with the following spec: Stancor P-8352 with the following ratings: Pri 117 VAC, SEC: 290-0-290 (580 VCT) @ 240 mA DC, 5 V @ 3 A and 12.6 VCT @ 5.25 A. There are also 4 tubes in the unit: 5V3 Full Wave rect, 6AS7G large octal power reg, 6136 mini 7-pin and a 5651 87V gas VR tube. Also has a 20 uF / 500 V dual section twist lock capacitor, and some power resistors and other parts. There is no top or bottom cover, but I can supply a piece of 1/16" aluminum to fit. I traced one of the units out before and can supply a schematic. Asking $30 plus UPS (36330 zip, total wt appr 28 lbs). Also have units missing tubes or other parts which I will knock $5 or $10 off.
Email or call 334-347-5281 day/eve

This radio was purchased from Lentini Communications in CT on 2/23/00 and has 2 hours use. It is like new in the box with sales receipt, hand mic and all documentation. Still under ICOM warranty. Tested on all bands and works flawlessly. Has FL-103 SSB Wide Filter, FL-223 9Mhz IF, 1.9Khz, SSB Filter and UT-102 Voive Synthesizer Unit all installed by Lentini. I am selling this radio to finance a boatanchor. I paid $1,423.80 on 02/23/00. The first $1075 will take the package including shipping (double boxed) and insurance.

Source record: 55919

Hi All,
Went to the local hamfest and learned a new trick (duh).
Stood in line for 45 minutes (was the 4th or 5th person in line) in the hopes to get a good shot at finding something. The doors open and there are already a dozen folks wandering around in there, buying like mad. One of the fine fellows had just what I was looking for (a nice looking National speaker). Later on in the morning, I see him standing behind one of the tables selling his wares.
The trick I learned? Buy a table as a vendor. Put 5 or 6 pieces of pure junk on it. Take a friend along so he can watch your table while you run around 5 minutes before the official opening buying up all of the real bargains.
Optional final step is to put the bargains on your table at 5 times the original price, but that is up to you.
Turning off the bitchmoanwhine motor now.....
rgds,
Mark S.

Hi,

I have an oscillator made by B.S.R. ltd, of Old Hill Staffs
England, which i'm in the process of restoring.

The model is LO 50A manufactured around 1952.

I would very much appreciate info about this unit, valve
types as the rectifier and the markings on a couple of
others are gone, or possibly a circuit diagram.

Many thanks.

Tony

A few years ago I made the mistake of selling a SBE 34 with a #10
appearance but had a receive problem for $30 to one of these
"Gentleman". I informed the "Gentleman" of the problem. 1 hour later I
passed his table it had a price tag of $140 and a sign with the words
"Excellent working condition". Gee I wonder if that's why Hamfest
attendance is down.

My 2 cents....Buzz KF9CM

As Fred Rodgers might say:

Can you say dirtbag?

Dirtbag.

There ya go! I knew ya could. Dirtbag.

In Dallas, I am proud to say that I once had the pleasure of watching
a guy who had sold a piece equipment with minor problems at a
reasonable price to such a lowlife have the great pleasure of breaking
up the guys scam. Just as the reseller was about to close a deal on
the "like-new condition" radio, the original seller walked up and told
the 2nd buyer the truth. The 2nd buyer, who had been saved being taken
by a matter of seconds, just about came over the table after the
reseller, attracting a GREAT deal of attention in the hall. The
reseller gathered up his wares and beat it in quite a rush.

On occassion, there is some justice in the world.

2124. Re: IS Ham Radio Dying? (Was Newark Store)

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-03-04 04:27:16 UTC
From: none@none.com
Message-ID: <97sft4$41h$1@slb0.atl.mindspring.net>
Source record: 55934
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.amateur.misc

The stats can lie if you make them lie.

You gave raw figures that do not take into account the population increases in the US over these years.

If instead of raw numbers, one takes the numbers you presented and figures out the percentage of hams in proportion to the US population you get a clearer picture:

Year Hams US Population Percentage
1917 6,000 103,268,000 0.006%
1928 17,000 120,509,000 0.014%
1936 46,000 128,053,180 0.036%
1950 90,000 152,271,417 0.059%
1956 140,000 168,903,031 0.083%
1958 160,000 174,881,904 0.091%
1963 250,000 189,241,798 0.132%
1977 327,000 220,239,425 0.148%
1989 500,000 246,819,230 0.203%
1997 678,473 267,783,607 0.253%
2001 682,240 277,228,212 0.246%

So, even if one takes into account the artificial surge in Ham Population attributable to the "Codeless-Tech Barrier Lowering" of the early 90's, the ham population is beginning to decline.

Stand by to see the numbers decline even more as individuals who came in on the wave of the 90's allow their licenses to expire. Care to make a wager on which way the numbers will move?

Who in the heck would want to be a ham after reading the garbage in this group anyway?

No wonder the ARRL is whining about declining membership! Is this why they keep raising their annual rates? The ARRL is just more of the same old "same old".
Next thing ya know, the "ten-ten" club will see a well-deserved drop in fees, too.
Money wasted on both accounts if you ask me.
Besides..your stats show that the Ham community is actually growing year to year. This is evidenced by the callsigns that are no longer available and as new ones are being issued.
Now go take on the day.

I have the same TNC and use HyperTerminal. I am tempted to break out my old TRS80 color computer since there are instructions for making a cable for it and I still happen to own one. I knew there was a reason I never got rid of that thing... :-)

The TNC itself doesn't need any software as the configuration stuff and operating modes are all built in. You only need a terminal program (of almost any type) to access the TNC.

So you saying that because the numbers as a percentage of the population is decreasing, that ham radio is on the downhill slide? Have you not listened to all the controversy over the population count? The government took special pains to accurately count the homeless and illegal aliens this time. I don't think that either group has a lot of interest in Ham radio. The raw numbers tell another story. Once again how does one interpret the data. I think you would agree that if we were to cut the number in half we would still be at the level we had in the 60's.

With people like you as well as some of the others that have responded in the same manner, it's no wonder the hobby isn't doing as well as you would expect. Maybe your daughter needs to monitor this group for a while, then make a decision whether or not she would like to associate with the losers that spew similar tidbits. Clean it up there, Rev. Roger! Your language indicates your intelligence level!

The best way to buy the good stuff is to go outside by the loading area as soon as the doors open for loading (iusually the night before) and watch and wait. It costs nothing.

You can even offer to help unload. Buy the good stuff even before it gets in the door.

Do the same thing on swap day. The trick is to park your van or trailer close enough so that you do not have to pack it far.

You also need an understanding wife, when you bring home much more than you took down. One trick is to load up the trailer two days before the swap meet (in front of your wife). Then, unload it while she is sleeping.

When you come home, leave the stuff at a friend's temporarily and come home with the trailer empty and proclaim how much stuff you sold. Then, bring home the new stuff in your car (30 or 40 trips) throughout the next several weeks.

First, it seems to me that while the number of amaterus vs. the population may be a matter of genuine and healthy debate, the steady decline in manners of the population are not.

It's easy to cuss, but it takes a bit more practice to get your point across without.

How do you think we look to prospective hams, or potential BA enthusiasts, or younger folks (that may be reading this NG with parents), when we respond to a flaming post in kind? Are we any better?

Think about it before you pickle that next post.....

2148. Heathkit HW-30 for sale

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-03-04 17:51:40 UTC
From: ptracy@aol.com
Message-ID: <20010304125140.13684.00000099@nso-fo.aol.com>
Source record: 55758

Please read carefully. - not in original condition.

I have for sale a Heathkit HW-30, 2 meter am tranceiver, also known as a "TWOER".

This is NOT in original condtion. It has an added i.f. strip, which if memory serves me correctly changed the receiver from a super-regen to a single conversion / 10.7 MHz i.f. It was purchased by my father back in the 60's and I remember him using it mobile.

It has been sitting on a shelf out in the garage for at least 10 years and quite simply is excess to my needs. Had thoughts of a restoration, but too many other projects ahead of it.

I do not have the manual, microphone or power cord, this is the tranceiver only. It has one crystal, 8094.5 KHz installed, which I believe is multiplied x 18, for 145.7 MHz. 2 of the tubes on the main chassis, the 6BA8's, appear to be the original Heathkit tubes, as they are marked "HEATHKIT" May be of some interest to collectors.

I opened it up, blew out the dust, and checked to make sure all the parts and tubes are there. It is complete in this regard. The "extra" i.f. strip has 3 tubes, 1 6EA8, 1 6BH6, and 1 12AU7A. The case has 3 extra holes in the top. 2 for securing the i.f. strip, and the third on the right side near the front used to acess a tweaky cap, possibly for tuning or antenna loading. I just don't remember.

Selling as is without any guarantee other than it is complete. Assume it is in non-working condtion. It is a bit dirty from sitting in the garage, but it has been dry. No drips from leaking paint cans, oil, anit-freeze, etc..... I have no way to check the radio to see if it works or not.

I am asking $45 + actual shipping costs via USPS Priority Mail, or the other cheaper method if you prefer. Due to time constraints, I can only ship on Saturdays.

Thanks.

2151. Heathkit AM-2 SWR Bridge.

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-03-04 18:24:01 UTC
From: ptracy@aol.com
Message-ID: <20010304132401.23316.00000386@nso-ck.aol.com>
Source record: 55760

I have for sale a Heathkit AM-2 Reflected power and SWR Bridge.

I don't know when it was made, but I remember my Dad using it when I was just a wee one. Late 50's / Early 60's? Don't know.

On the 1 to 10 Scale, I'd give it a 6 to 7. The meter cover is slightly yellowed. Knobs look dirty, and a bit faded. It is not blemish free, but the case has not been hacked up, dinged, or dented. The rear panel has the words "IN" and "0UT" hand printed in magic marker over the SO-239's. It functions, but I make no guarantee as to it's accuracy or directivity. Sold as is.

Asking $25 + shipping.

Thats the cleanest thing you've ever posted. Whahaaaaa. Keep it
up and you might be taken seriously. Don't bother crying to my
ISP for spamming because I replied to your wank like you did
before, Rog.

2155. FS: HALLICRAFTERS SX-43 receiver

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-03-04 21:10:54 UTC
From: WA2BAH@webtv.net
Message-ID: <27769-3AA2AF5E-29@storefull-152.iap.bryant.webtv.net>
Source record: 55768

Hallicrafters 1947 model SX-43 general coverage receiver in very good operating condition - caps recently changed, etc. This is the same model receiver that is pictured on the front cover of March 2001 QST Magazine. Two of the knobs are National - not Hallicrafters & the case could use touch up paint in a few spots - comes with a copy of the schematic - $200 plus s & h from Schenectady, NY

LIST OF ITEMS FOR SALE: (revised 2/27/01)

2156. Wanted HP8554L Info and HP140/141 Spectrum Analyzer Parts

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-03-04 21:21:20 UTC
From: Allan Henry Kaplan <w1ael@mindspring.com>
Message-ID: <3AA2B1D0.98ED09E2@arrl.net>
Source record: 55766
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.boatanchors

I am looking for information on the HP8554L. This is the "economy-model" of the HP140/141 Spectrum Analyzer RF plug-in which covers up to 1250 MHz. I have the 8554B manual and it does not identify the burnt component on my Bandwidth switch because the L model wiring is different in that area. I am also looking for Amphenol Series 26 connectors, the blue 24-pin jobs on the rear of the plug-ins so I can reproduce the HP extender cables which allow access to the
plug-ins under power. I need two pieces each of 24-pin Amphenol Series 26 mating connectors, 26-4101-24P and 26-4501-24S. Chances are that I could use parts with some variation in the middle number (4x01?) provided that they are mating pairs of Series 26 24-pin units. I will appreciate any leads you might furnish. The IF and RF plug-ins stack vertically using a mated pair of DBM-50 (Cannon et al.) with two coaxial inserts. I'd sure like to find a pair of these also.

Please copy to my e-mail address which is <myhamcall at arrl dot net>. Use the correct punctuation on the email address which I messed up to fool the spam-bots!
Thanks!
Allan (W1AEL)

Perhaps my math skills are deteriorating due to my advanced old age (46), but that chart appears to indicate not a drop, but a continual INCREASE in the number of licensed hams in the US.. both as raw numbers AND as a percentage of population (per capita)... Am I wrong? Anybody?

I have little knowledge of tube equipment - although I read about it as a kid, by the time I did engineering and got into ham radio, tubes were largely a thing of the past except for high power amps.

A local ham died and his estate is unloading his Drake TR-4C (I think that is the number), the antenna tuner, power supply, etc. As far as I know it works well.

Any comments on this equipment? Is it considered good? Useful? Or was it a dog model from Drake (even the good companies make bad stuff, sometimes!) Any things to be especially wary of? A good set to buy?

Thoughts would be appreciated - I am wondering about entering the 'boatanchor' world.

Do I need to think like you to be up on the times? I don't think so, bucko. I also don't think this hobby needs the likes of you. Why not try another life? Also it may be wise to keep your daughter out of the gutter and the men's locker room. She may thank you when she's 40ish. Afraid of you? MWAHAHAHA! As you would say!

Hi,
My name is Kees, PB0AIA, from The Netherlands.
I am looking for information on the HP8551 Spectrum Analyser. I don't know much about it, I don't even know if what I have is a complete set, or one and a half set, or that I am still missing an important part. I have three cabinets: a 8551 Analyser, a 8551B Analyser, and a 851 display unit. Do I need any more equipment to get a complete working machine? Does anyone have an operators manual I could buy a copy of? Is it possible to use a general oscilloscope in place of the display unit? I would like to get this machine working again, or both of them if I have two.
73, Kees PB0AIA

Look closely and see the decline starting at the last stat. I was merely presenting alternative numbers that I felt showed a little more than raw numbers of hams in the states. Presenting raw stats like the previous poster did is like comparing 1917 dollars to 2001 dollars without taking into account inflation.

I could really care less about which way the numbers go, just enjoyed finding out.

Hello. I am in the process of converting an Intech 2500 marine radio to
ham band use.It uses a Collins mechanical filter to derive the USB
signal. LSB was available as an option and replaced the AM filter
with an LSB Collins unit. I have the service manual
but it does not list the Collins P/N for the LSB filter.
The USB unit's P/N is 526-9897-010.
From the filter list @ http://www.wa3key.com/filters.html#master
I have determined that the correct filter will be a 526-9939-010.
If this is incorrect, please let me know. If you have one for
sale or know of where I can get one for
less than a kings ransom, please let me know.

HF-281 & HF-282 526-9897-010 USB 1.95
HF-281 & HF-282 526-9939-010 LSB 1.95

Thank you,
Randy KB8ASO

Hi,

Can't help you with the connector, sorry. I just bought an ART-13 and
was wondering if you split the filament - heater circuit off from the
26 VDC circuit and fed it with AC. If so, where did you find an 8 Amp
26 VAC transformer to feed the heaters?

I need the transformer if you know of anyone who has one for sale.

I like mine medium well.

It's interesting...I've *never* seen the words "rare" and "Heath SB-anything" in the same sentence before.

Source record: 55645

Hi David,
It's a very nice unit, the last of the tube-type line from Drake. It evolved from the TR-3, and a long run of TR-4's. The C was about the end, they did add 2 small mods, one, the TR4-Cw had a 500cy filter for better CW, then the TR-4CWrit added RIT, but not too many of them were made b4 they stopped production of them.
It's a good transceiver, doesn't have the bells & whistles of the newer SS stuff from TenTec or YaeComWood, but still a great performer. 150-180w output, but the 5 "original" bands, no WARC bands, and can't be moved to them easily, if at all.
A TR-4C, with PS, Spkr, Tuner should go for $250-400, if in known operating condx. If it's been stored for some time (yr or more), the switches tend to get oxide build up, but a quick application of DeOxit usually cures any problem. The final tubes (3) are getting harder to find, and more expensive.
I use my TR-4CWrit regularly, SSB & CW.
Hope this helps,
73,
Al, W8UT
New Bern, NC
BoatAnchors appreciated here

I think there is another way of looking at this.
With the popularity of the Internet and the number of hours that
people spend on the Internet its a very good testomony to Ham Radio
that the numbers have not decline even more.

Instead of crying about the lower number of hams why not do something
about it? How many people a year so you tell about Amateur Radio?
Without all the crying about the licenses changes and boo hoo because
you had to know the code and a new guy does not.

I think that a lot of people that might take the time to learn enough
to get a ticket decide that they are not wanted because they listen on
the air (just like we all did, I listened while I was studying for my
licenses) or in these newsgroups. In stead of hearing a lot of
friendly people getting along with each other and possabley finding a
Elmer to help them on there way they hear all the negitivity about
some licensing changes that they dad nothing to do with.

One important thought, if we do not get new hams into the hobby
someday the goverment will take our frequencys away and find a way for
those frequencys to generate revenue.

Find some way to promote our hobby, post class skedules, talk with
techie people, help them put up am antenna, Do Something.

Now dismounting soapbox,
Delbert McCord

Del... quite right.. it's we ourselves that have the power to save the service. We are supposed to be ambassadors, representatives of our countries.. but more, of our service and our hobby. Infighting never did do anything for any organization, other than to destroy it. As far as licensing changes go, was it not we ourselves, through our representative organization, the ARRL, that brought these changes about? Certainly they did not fight for these changes on their own volition, after all, they already HAD their licenses.

One point of disagreement however, that people seem to be laboring under a misconception about. The FCC MAY consider denying American hams use of the amateur bands, but they cannot, but treaty, offer these bands up to other services for profit. The amateur frequencies have been internationally allocated by the IRC and WARC conventions and the US is a signatory.

Please folks.. let's enjoy the bands, and the people.. and show our best sides to the world... :)

I have a matched pair of R&S multicouplers, which cover 10-1600 kHz and 1.6 to 30 MHz respectively; have metering for checking tubes, grey color like EK-07D receiver, AC powered, model numbers NV-4/70 and NV-2/60, feed identical ouput to 6 receivers each. 19" rackmount about 5" high each, with removable sleeve covers.. Standard PL259 coax connectors. The power cords are not original. One pilot light plastic cap is broken. Parts of chassis appear silver-plated (well, what do you expect from R&S?). Will sell as matched pair ONLY at $500, plus shipping, insurance. EMail only

2203. Heath Sixer Schematic & Microphone question

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-03-05 16:27:46 UTC
From: gtiguyNOSPAM@hotpop.com
Message-ID: <980eq2$l8i$1@news.pa.net>
Source record: 55688

Hello all:

I recently purchased a Heathkit "Sixer" and had a couple of questions. First, does anyone know where I can get a schematic for it? The "catch" is that I have the "one year only" HW-29, NOT the HW-29A. I downloaded the complete assembly manual/schematic for the HW-29A, and it's not the same... I would prefer to be able to download the schematic, but will consider other options as well.

The next question is, what kind of microphone does this thing use? Is there a "modern" replacment, or do I need to use a "vintage" mike? Where might I get one?

(If replying by e-mail, remove NOSPAM from address)

Thanks in advance.

2204. Help appreciated getting an old Henry Tempo One back on the air.

Hi
Obviously Tom Sevart is not going to make good on this JUNK Icom R71A
he sold me for 400.00 stating it was an excellent radio, which is a
parts radio. It comes with Remote Control and has FM in it, if that
means anything.
I'm forced to sell it as a parts radio, because it doesn't work.
So, being an honest person, thats how I have to sell it.
As is, parts only.
Please make an offer. Again be aware of Tom Sevart N2UHC
Here was a copy of his ad.
I have an R71A for sale in excellent condition. Coverage is 100 KHZ -
30
MHZ AM/FM/USB/LSB/CW/RTTY. 32 memory channels. Optional FM board
installed
& remote control included. Owner is a non-smoker. I am asking $400
firm.
The receiver can be seen at http://photos.yahoo.com by clicking on
"Radio
Pics." I want to sell this receiver so I can buy an R75. If
interested,
contact me at n2uhc@yahoo.com.

Want to trade a GK 500 for a Johnson 500???

Just Kidding

If you do run across a Johnson 500, let me know and I'll let you know if
I see a GK 500 available, OK?

Take care

Hi Boatanchor Fans

I am looking for a Globe Scout 680 transmitter. Does not have to be in working order but should be in good cosmetic shape. Please respond to me by e-mail or call 716 741 3776.
Thanks,
Bill Gittere K2LNU (near Buffalo, NY)

David,

I'd say go for it! Never used one myself, but from what I hear the Drake is a fine piece of equipment.

I grew up with boatanchor gear in the 50's, then abandoned the hobby completely for nearly 40 years. I'm back again with - you guessed it - similar gear to what I used back then.

My biggest hurdle was remembering to be careful of the high voltages. You get used to the low voltage SS gear, and tend to forget you once had to be careful where you put your fingers.

I am currently setting up a Hallicrafters SX-117 and Heathkit HX-10 for the HF bands, as I just got my General back last year.

73 and Happy Hamming

Hi, Allan -

HP's RF spectrum analyzers were and are made by their divisions in Santa Rosa and Rohnert Park here in Sonoma County, California. The local ham club is the Sonoma County Radio Amateurs (http://www.cds1.net/scra/). If you send them a note, I suspect you'll find all sorts of expertise.

With over 100 engineers in just their Signal Analysis Division (spectrum analyzers) when I left there in '89, they have quite a few very active hams, including several who have published widely. They're "Agilent" now, but still a good bunch. And the club is first rate.

Best of luck with your analyzer!

Jim Horn, WB9SYN/6 Penngrove, CA

Is it a conduction cooled PA? I have a Motorola PA that uses a 8560AS conduction cooled tube I do not have the schematic but I did draw one out I use it on 144 Mc. SSB
Excellent P.A. for 2M a little change should be made in the output coupling but not really nesisarry..,

Since you said VHF and heat sink, I'll throw out that the tube was
probably an 8560 and the unit a vintage early Micor or late Motrac Base
Station Repeater type. The often white block inside the pa cab is
beOxide, just be carefull not to sand or breath dust from any broken parts
of it.

Hit the flea markets and have a look around for the Motrac Series of high
powered base / repeater units. God knows I worked on enough of them in my
day...

I've converted the Heathkit SB-230 conduction cooled amplifier to run on
the 8560 tetrode.... similar mounting and lots of gain when set up
properly.

cheers

Steve,

I guess if by disagreeing with someone means that I came here looking for an attack you are right. If you mean that I am trolling, you are mistaken. I understand that there are individuals in this group who have nothing better to do than argue meaningless minutae, but I wished to have a serious discussion on the issue. Is asking for a civil discourse on a subject we all care about asking too much?

BTW, I hide my identity to keep from getting spammed. If it would make you feel better I could e-mail you using my real address. We could then proceed to discuss the matter of declining ham population in a reasonable way.

>The stats can lie if you make them lie.

And your table below proves that! You've formed a ratio of two independent variables (no where did you show there is any direct dependent relationship between the two). Your percentages ONLY show that the rate of population growth is greater than the rate of amateur licensee growth; yet both are growing at independent rates, though. For example, internet and cellphones do not affect general population growth, yet one suspects both those modes of communication might possibly have an affect on amateur growth (yet amateur growth still occurs at a positive rate).

I suspect you've read the book, "How To Lie With Statistics."

Why not make up a table comparing the annual amateur population to the annual particle count of the ozone layer and draw a conclusion from the sequence of calculated ratios? (Yikes! An increase in licensees is causing a decrease in the ozone layer! Run for your lives! :)

2229. HRO-M S Meter and operation/problem question

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-03-06 09:10:19 UTC
From: berntd@prism.co.za
Message-ID: <3AA4AA15.95A5A590@prism.co.za>
Source record: 55689

Hi all,

I did post some while ago about my new HRO.
Well, I now have the thing working (sort off).
I had to replace 2 6D6 valves and most of the resistors. They have all drifted to a much higher value.
The capacitors seem ok and I tested a couple of them but there might still be a problem there somewhere and I will look at that again.

My main problem at the moment is the S-Meter.
I have loaded the service manual from the net and tried to see how the S-meter is supposed to be used.

To start off, all the resistors in the meter circuit are well within spec.
The '0' control preset pot does make only a very slight difference.

Either mine does not work that way anymore (broken!) or i am not operating it correctly.

With the AVC OFF, my S-meter goes to full scale positive when adjusting the RF-gain to 8 or lower. It seems that the needle is going to bend on the meter is one keeps doing this.
With the RF-gain adjusted to 9 and higher, the meter does the same but negative.
There is a point where the meter shows about zero when the RF gain is around 9 or so.

I am worried that the meter will get damaged if one carries on like this.

Turning on the AVC makes no noticeable difference to this situation either but when adjusting the RF gain to zero the meter, the meter starts showing sort of signal levels.

I really hope that this is not part of the design and that there is some fault on my receiver! I am a bit suspicious to see a On/Off switch for the meter.

Maybe someone with a good working HRO or experience can explain to me how the meter is supposed to work and how to operate it.

My next question is about the RF-gain control. When this is adjusted on any setting below 8, the receiver goes completely quiet. No more noise or anything. The pot and resistors are fine. Is this normal or should I get some reception at least??

I would really appreciate some more information.
Kindly copy the postings to my email address because I can't seem to get
this group updated at a useful pace.

Kind regards,

Bernt

July 11, 2000

CERTIFIED MAIL--RETURN RECEIPT REQUESTED

Mr. Roger L. Wiseman

610 Glen Haven Avenue

Glendale, WV 26038-1302

SUBJECT: Amateur Radio license KC8JBO

Dear Mr. Wiseman:

Pursuant to Section 97.519(d)(2) of the Commission's Rules, 47 C.F.R. Section 97.519(d)(2), the Commission has the authority to re-administer any examination element previously administered by Volunteer Examiners (VE's). The Commission may either administer the examination itself, or under the supervision of a Volunteer Examiner Coordinator (VEC) or VE designated by the Commission.

Accordingly, we are requiring you to re-take the General Class Amateur Examination, (Elements 2, 3(A) and 3(B)) under the supervision of an American Radio Relay League Volunteer Examiner Coordinator. This examination must be completed on or before September 11, 2000. The required code speed that you must demonstrate is 5 words per minute.

Please be prepared to verify your current address and to present a photo identification. Pursuant to Commission rules, your license will be cancelled if you do not appear for re-examination. You will be granted an Amateur Radio license consistent with the elements you pass upon re-examination.

Sincerely,

W. Riley Hollingsworth

Special Counsel, Amateur Radio

Enforcement Bureau

2231. R-390/URR for sale

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-03-06 12:28:14 UTC
From: radiomatt@aol.com
Message-ID: <20010306072814.12954.00000001@ng-df1.aol.com>
Source record: 55692

Pickup on Long Island:
Collins R-390/URR complete with top and bottom covers and ORIGINAL power cord. Original meters, too. Works fine, but could use tweaking. $550

Also available, second R-390/URR without top and bottom plates, and no power cord. Original meters. Paint around tuning knob worn away from use. Works fine, good calibration. No name plate. $400

2232. Racal RA-337 VLF Adapter - new

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-03-06 12:47:33 UTC
From: radiomatt@aol.com
Message-ID: <20010306074733.12954.00000005@ng-df1.aol.com>
Source record: 55693

This is the 3kHz-980 kHz solid-state adapter which mated with the RA-6217 and similar receivers, taking the 16 volts, and 1 MHz freq standard from the radio, and upconverting the VLF range to a higher band. The unit is new, but missing only the knobs and the front panel, but works without them just fine. There are some really high quality coils inside, and workmanship is mil-spec. There is a small (about 1" square) window which has the tuning scale for the preselector stages (can be bypassed), and the range is covered in six bands (really sharp front end). It is about 2" high, 6" wide, but 18" deep (excluding knob shafts and connectors). I bought it new from RACAL a dozen years ago as a spare for my other unit, but I sold it. Price is $135 + shipping..

2233. WTB National SW-3 Coils

Message-ID: <j1iaatohsfo40ioc8f87pamdpoorhehotq@4ax.com>
Source record: 55594

Hi folks... Have a Kenwood TR-2200A 2-meter rig here in pretty good shape, but would like to make it complete. In order to do that, I need to locate a telescoping antenna and batteries for this radio. If anyone can lend assistance, I'd appreciate it. The antenna apparently has a threaded collar, not sure of any other particulars about it. From the looks of the battery compartment, it would appear that these are of a relatively odd design, any info would be greatly appreciated. Thanks much...

Guys:

I live in an area that is plagued with line noise and for the past 10 years I have tried to find it and failed. It is sometimes 10 over. I have had some radios that have fairly good NB but they all distort the audio. I just got a JPS ANC-4 as a last resort and it should have been my first! It is fantastic!! I am now hearing stuff that I could never hear before and the noise can be nulled with no negative effects .. NONE! The holes in my eardrums will probably now heal.

I don't have any ties to JPS and certainly don't have one for sale, in fact I'd love aother as a backup. Just thought that you'd like to know and if you have a line noise problem, my advice, is get one now!

Larry W9MDX

Does anyone else go back to the 1930's? Remember Cantor the Cabinet King? And Blan the Radio Man? Both of these stores were on Radio Row for years and years. Wonder whatever became of them? Arrow Radio had a shop on the Street too -- the forerunner of what it is today, a very large distributor. I remember one of the guys who ran it -- W2IEK -- because we went to high school together. Barrels full of tubes, a nickel apiece. "Guaranteed to light," they used to tell us kids, not a word about how they worked, though!

I remember the early 30's, when times were very tough and grown men were selling apples on street corners. Needless to say, money was very tight. There came a Saturday when I rode the subway downtown from the Bronx with money I had painfully saved a nickel and a dime at a time by going without school lunches and walking instead of taking the bus. It was all of $3, but a huge sum for me. It was to buy a tube for my first transmitter. I don't remember where or when, as the song goes, but I can still hear the sound the tube made when it slid out of the back of the box, from where it was tucked under my arm, and hit the pavement, shattering in a million tiny slivers. What a day... It seemed like forever until I finally got a replacement when I scraped together another three bucks.

For the benefit of the stray reader who isn't familiar with the area's history, the reason Radio Row disappeared -- bottom line -- was money, money, money. The construction pf the twin towers of the World Trade Center, which are in the immediate neighborhood of where Radio Row was, was the final straw. Shops were forced out by higher rents and condemnation proceedings -- many of the neighborhood's buildings were old and rickety. Apparently most of the store owners just gave up, although a few did survive scattered around outlying areas.

I have another radio tale with a happier ending than the little kid and his busted tube...
In 1945 I traded my car, a 1936 Pontiac that was much the worse for wear, to a gent who had a BC312 -- or was it a 342? Plus he threw in 50 bucks. Anyway, it was a five or six band receiver used in tanks. I don't remember the frequency coverage but I did manage to use it for hamming on at least one band if not two or three. It weighed a ton. I kept it for a long time. Eventually I passed it along to an old friend who liked to listen to Radio Moscow, and other propaganda broadcasts. The guy who got the car got a bargain too. I met him accidentally a few years after we traded. He said he'd driven it for three years with hardly a problem!

73 to all.

Expensive, but worth it!
A complete digital decoder receiving station for Broadcast, News organizations or very serious amateurs

THREE VLF/HF RECEIVERS: 2- Icom R-71a with FL-44 filters, rackmounted and 1- JRC NRD-515 with KIWA filter and 10-turn fine tuning control
MULTICOUPLER: Aiken 108-- One antenna input feeds up to eight receivers
FIVE DECODERS: Universal M-8000, Universal M-6000, Universal M-600, Universal RTTY tuning scope, 2 InfoTech M-200F units(side-by-side mounted in rack mt)(all decoders are rackmounted)
FOUR DISPLAYS: Panasonic Professional rackmounted triple 5" B&W monitor, single SVGA 14" monitor (for M-8000)
SPEAKERS: Three Realistic Cube speakers for receivers
Everything is designed to be mounted in 19" racks except the JRC receiver, the speakers, the multicoupler, and the SVGA monitor. This is a pro setup in both appearance and performance.

With this setup, you can connect an antenna, and decode CW, RTTY, FAX, WEFAX, SITOR, and DOZENS of other digital modes between 100kHz and 300 Mhz. Check "www.DXing.com" website for info on the decoders and receivers.

Price $4000 Two black table racks can be added for $200 more.
Location New York

2263. FS: Racal RA6790/GM Service Manual

Newsgroup: rec.radio.amateur.boatanchors

2272. WTB: Ameco AC-1 transmitter - want to put on the air!

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-03-07 23:59:54 UTC
From: Dave <newsgroups@BoatAnchors.com>
Message-ID: <986i29$qo5$1@nnrp.atgi.net>
Source record: 55633
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.swap

I know I'm looking for the needle in the haystack, but I'd really like to find the one transmitter of my youth I wish I had kept. I had an Ameco AC-1 that I used on the air with an S-85 receiver, before I got a Globe Scout 680. Once I had that, the AC-1 went bye bye with a box of other stuff in trade for a telescope!

I'm not a collector, and I'm not rich. I promise to put it on the air, and will schedule a QSO with you even! I want to pair it again with the very same S-85 from my youth.

I also promise not to sell it! But wait - there's more! I'll even post a photo of it with the receiver on my web site and credit the kind soul who parted with theirs so that I could put an AC-1 back on the air!

Condition is pretty irrelevant, as long as it's repairable. I have lots of bench space, boxes of tubes, and a desire. Pretty much ANY AC-1 would do.

If you have an AC-1 with which to part to a good cause, drop me an email.

Dave WB7AWK

I think the needle within the haystack will be easier to find!

Go to:

http://www.qsl.net/wb1gfh/ameco.html

and build an exact duplicate. They are pretty simple and - FUN - to build!

Anyone can do it....

It's such a shame that most of us don't.

Too old and lazy now I guess.

I'm going to my IC756Pro now.
The LCD screen is flashing "coffee is ready".
Now what button do I push to get the DSP to pour it?

2280. FS.Rees Mace (tube)Communications Rx.

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-03-08 12:47:27 UTC
From: "radio-exports.com" <info@radio-exports.com>
Message-ID: <taevos84019dda@corp.supernews.co.uk>
Source record: 55639

For Sale:Rees Mace Communications Receiver,Type BR2169

This is an extremely well made Communications Receiver manufactured by the British company,Rees Mace in the early 1950's.
The receiver uses 12 tubes in a superhet circuit and offers continuous coverage from 55kc,s to 31Mc,s in a total of 8 switched ranges,using single conversion on 4 of the ranges and double conversion on the other 4 ranges.

The receiver is very compact and measures approximately 12" cubed.
The set has a large rectangular tuning dial with the 8 frequency ranges clearly marked and there is also a logging scale.
The set incorporates a very high quality reduction drive to the tuning knob. The ratio of 48:1 makes tuning a joy and the reception of ssb and cw signals very easy,using the effective BFO.

The tube line up is 6BA6 RF Amp,ECH81 1st Mixer/Crystal Osc.,6C4 1st Osc,ECH81 2nd Mixer/Osc or 1st IF Amp,EF92 IF Amp,EF92 2nd IF Amp,EB91 AGC/Det,EB91 Noise Limiter,EF92 AF Amp,6CH6 Audio Output,EF92 BFO and a QS150/45 stabiliser.An impressive line up!
First IF is 1.4Mc's,2nd IF is 460kc's.
The set has four position switched selectivity,the narrow position using a crystal filter.
Other controls include BFO on/off,BFO Tune,AF Gain,RF Gain,AGC,Crystal Switch,& Band Indicator

All in all,this is an extremely nice receiver and a worthy addition to any serious collection of tube communication receivers.

The receiver is in very good condition and is in full working order.

The price,which includes the cost of packing and air freight to the USA is $495 US Dollars.

If you would like further details or wish to order,please contact Graham Leo info@radio-exports.com

Thank you for your interest and time.

I am looking for CB radios and walkie-talkies from Raytheon,
Apelco, and Webster for my personal collection. Any model,
any condition will be considered. Also need crystals, hand
microphones, mounting brackets and hardware, manuals, sales
brochures, service information, magazine ads and reviews,
and so on.

Drop by my Raytheon CB web site for a bit of interesting
and off-beat historical information, photos, etc!

http://www.qsl.net/k5dh/raytheon.html

Before I get "bashed" for posting CB-related stuff on the
amateur radio newsgroups, I must point out that the HUGE
majority of equipment and historical information that I've
been able to acquire so far has come from HAMS, not from
CBers! Many of today's hams were CBers "back then".

73,
Dean, K5DH

Source record: 55696

I don't go back to the 30s, But I do recall Blan the Radio Man from the early 50s. Wasn't he the guy with the orange-and-blue metal sign above the store?

My favorite place around Cortlandt Street, though, was Leotone. Remember: "For a Better Cone Buy Leotone"? And of course their famous rack of tubes out front: "Guaranteed to Light 5 cents."

I don't know how many times I went down there, list in hand, to places like Federated Purchaser. I'd hand the list across the counter and the guy would virtually fly all over the place: a 10-cent resistor here, another there, a condenser across the way, a transformer from the back room, a few tubes, a couple of spools of pickup wire. An rf choke--all from an ancient Radio Handbook for my latest project. The total was seldom a great deal of money, but boy was that a labor-intensive business. You'd go down there for a couple of bucks worth of resistors and it would cost the company almost almost as much as it was paying the clerk in salary to gather the parts together for you. So it's not hard to see why they're all gone--regretfully.

Mike, do you still have the Variac? The ART-13 power supply I built is either to high or too low in voltage for C or L input filter. I can't win, so I need a Variac. I have several NIB 2.5 Amp units (too small) and my 15 amp bench unit is overkill!!! hi. I'm over here in Frederick, MD.
Thanks
Jeep/K3HVG 301-831-6022.

a. MARCONI SERVICE MANUAL VOL NO. 1

This a hard covered book which contains the following schematic, tech info and parts list. 500 pgs total. Over 200+ models covered in this book. Condition rates good. Cicra 1930-1960?

ï¿½ Marconi Tuner Unit Type XIV (D.C)
ï¿½ Marconi Tuner Unit Type XV, XVI, XVII, XVIII (A.C)
ï¿½ Model 15-18, 19(D.C), 20(A.C.), 21(A.C), 22, 23(A.C)
ï¿½ Model 26&27 S.W. Converter
ï¿½ Model 29, 31-31 SW, 32, 32B
ï¿½ Model 33 to38, 40, 41, 43, 44, 46, 47, 48
ï¿½ Model 49 & 51
ï¿½ Echo Models 50 & 60
ï¿½ Model 650 to 660-TD, 680
ï¿½ Model 53, 54, 55, 57, 58, 59
ï¿½ Model 60-61 & 60A-61A
ï¿½ Model 62 to 78, 79-79c, 80-88, 88A, 89, 89A, 90
ï¿½ Model 93 to109
ï¿½ Marconi No5 &6 Power Units
ï¿½ Model 110-121,123,124,126,127,128,128A,129, 129A
ï¿½ Model 130 to 171
ï¿½ Model 180,180A, 181,181A,182, 183A,184,184A
ï¿½ Model 185 to 188,188A,190, 191,193,194.196,197,198,199,
ï¿½ Model 200, 200A, 200B,200C, 200D,200E
ï¿½ Model 201,201A, 201B,202, 203,206,207-215
ï¿½ Model 291 & 294
ï¿½ Marconi Tech Data/Parts List No1 & No2 Record Players

b. RCA VICTOR SERVICE MANUAL VOL TV-II RECIEVERS

This a soft covered book which contain the following schematic, tech info and parts list. 220 pgs total. Over 50 models covered in this book on TV receivers, Cicra 1952-153. Condition rates good.

ï¿½ Models U1AR-U1BR-UICR // U2A, U2B, U2C
ï¿½ Models 14T401-14TA601 // 17T43-17T45-17TC55
ï¿½ Models 17T46-17TC56-20T74-20TC85
ï¿½ Models 17T47-17TC57-20T75-20TC86
ï¿½ Models 17T100-17T101-17TC110
ï¿½ Models 17T100A-17T101A-17TC110A-17T100A (Arborite)
ï¿½ Models 20TA91
ï¿½ Models 21T72-21TC81-21TC83
ï¿½ Models 21T102-21T103-21TC111-21TC112-21TC115

ï¿½ Models 27D383

c. RCA VICTOR SERVICE MANUAL VOL IV RADIO RECIEVERS + PHONOGRAPHS

This a soft covered book which contain the following schematic, tech info and parts list. 290 pgs total. Over 70 models covered in this book on AC Receivers, AC/DC Receivers, Auto Receivers, Battery portables, Battery Receivers, Radio-Phono Combo's, Record Changers, Record Players. Circa 1945-1948 Condition rates good.

AC Receivers

ï¿½ M45,46,47A,50,51,62,80,81

AC/DC Receivers

ï¿½ 54X, 60, Baby Nipper, Little Master, Little Master A, Little Master II,III,IIIA
ï¿½ Master, Master Nipper

Auto Receivers

ï¿½ A-660, A660C, Clipper

Battery Portables

ï¿½ BP4, 5, 5A, 6, 6A, 6C, 10A

Battery Receivers

ï¿½ BT40, 42, 44, 60, VRB62, B417, B418

Radio- Phono Combo's

ï¿½ VR54, VRA55, 56X, 57, 65, 67, 67S, 73, 101C, 101M, 212, 123C, 123M, 141, 241, 249
ï¿½ VR 145,146, 245
ï¿½ Spinette

Record Changers

ï¿½ RP160C,178 & 960001-4, 960260-2

Record Players

ï¿½ V4X
ï¿½ V14,16,
ï¿½ VE20,22,
ï¿½ V26
ï¿½ VA34
ï¿½ VE66D
ï¿½ V84B

d. RCA VICTOR SERVICE MANUAL VOL V RADIO RECIEVERS + PHONOGRAPHS

This a soft covered book which contain the following schematic, tech
info and parts list.
312 pgs total. Over 84 models covered in this book on AC Receivers,
AC/DC Receivers, Auto Receivers, Battery portables, Battery Receivers,
Clock Radios, Radio-Phono Combo's, Record Changers, Record Players.
Circa 1949-1952. Condition rates good.

AC Receivers

ï¿½ 7Q51

AC/DC Receivers

ï¿½ 521D, 531D, 531F, 533D, 533F, X600, X602, 702X,
ï¿½ Little Master IV, Master X
ï¿½ Nipper,II,III (Wood)

Auto Receivers

ï¿½ A-550, 550X, 552, 552X, 558, 558X, 752, 754

Battery Portables

ï¿½ BP 5C,5D,6D,6X,6DX,61,61X,400,401,402,500
ï¿½ BX57,

Battery Receivers

ï¿½ BT 46,48,502,504

Clock Radios

ï¿½ Chanticleer, C-501, C57

Radio-Phono Combo's

ï¿½ 4QV8C
ï¿½ 9Y5, 5S

2292. Need OLD tube CB base for weird projecct

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-03-09 01:17:35 UTC
From: skydive@mailandnews.com
Message-ID: <3aa82de1.194611789@nntp.skybest.com>
Source record: 55703

Maybe I'm going crazier. Got this weird idea about making a 40 meter CW QRP rig out of an old CB radio. What I'm looking for is on of the OLD tube type less than 23 channel bases. They usually had several transmit channels requiring separate crystals for each TX channel. Receive was tunable over all 23 channels.

The radio doesn't have to work! It would be nice if the receiver worked, but I don't care about the transmitter at all. Hopefully the cabinet will be in fair shape so that my finished projject won't look too stupid.

PLEASE no solid state synth radios.

E-Mail what ya got and price to:

skydive@mailandnews.com

Plate idle current should be 75 ma ,anything higher probably means a bad zener in the bias regulator,plate volts I'm not sure of actual voltage,but should push peg on meter to extreme right,right to the peg. Hope this helps Paul

Hi all,
On March 9, 2001, I had the pleasure and honor of listening to K4ZDH at Youngstown State University, sponsored by the MVARA. He spoke for about 45 minutes or so and then took questions from the audience. He got a standing ovation, deservedly so!
His speech got me to thinking what we can do to "clean up the mess on 75 meters" to quote Hollingsworth. He handed out a reprint of an article in CQ magazine that I think hits all the numbers very well. My question is, how many are out there willing to contribute ideas, time and or help of some kind to follow K4ZDH's lead?
I am going to put this out for discussion at the next MVARA meeting and hopefully also the 20 Over 9 club which is local to me as well.
I am looking for suggestions and ideas. Oh yeah, the article from CQ magazine was written by Jeff Reinhardt AA6JR. Don't have the issue it appeared it, but the title is "Magic In The Sky." I highly reccommend it for reading.

Source record: 55723

Anyone know where to get male 11 pin plugs to fit the sockets on the Henry Tempo One Power supply and Henry Tempo One Transciever. I am restoring a tempo one and the gentleman who had the set could not find the cable. I have pinouts and if I can locate the male plugs to fit the female sockets can wire up a replacement cable.

The sockets look like tube sockets are keyed and have 11 pins.

In CW position the plate voltage should read about 2500 volts and about 3000
volts
in SSB position with no load. These readings should drop 300 to 400 volts
under load.
Resting plate current should be about .12 (120mil). 73, Mike K0AZ

Hi,
My Knight Star Roamer has a broken dial string. I replaced it once with an old style heavy black cord-like fishing line. This doesn't seem to be sold at sporting goods stores any more .
Any ideas on an acceptable substitute, or where to buy dial string for old radios? The manual doesn't give any material or diameter information.
Thanks,
Richard

I still use dacron fishing line (Gudebrod #518) though you can find "regular"
dial cord at Antique Electronics Supply. Radio Shack sometimes carries it also.
Personally, I prefer the fishing line, it seems a bit more durable.

Al,

The power supply is female and needs a male connector as described
below but I just noticed that the rig has a male connector and it will
need a female. I would need to obtain 1 female and one male to make
the cable. Do you have any female connectors of this type?

Source record: 55741
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.swap

Just as a follow up to my post asking for a wafer switch for the MN2000 tuner. The Drake service manager Bill Frost has one left and wants an exorbitant amount for it ($100 plus shipping and handling for a replacement wafer switch!!) . It speaks volumes when a manufacturer of a product will overcharge their customers for a part that goes inside something they made just because it is the last one available. It is one thing for a private individual to come across a part and charge what he wishes, but to have the manufacturer engage in this practice of price gouging is very telling. For example, HENRY sells every last part at a fair price based on what they paid for it at the time they bought that part, until that last part is gone!

Support manufacturers who treat you fairly!
Beware of those who take advantage of you.

Hello:

I have an untested Hallicrafters FPM-300 MKII and I need to do a functional test on it. I have a copy of the manual thanks to the BAMA (Boat Anchor Manual Archive) so I now probably know enough to wreck it if I do something *stupid* :O

I know that the toothed gear belt is rotten and the gears will need to be retimed when I find a replacement. Where can I get one/how much/retiming instructions/yada,yada...

I don't have an antenna and the mic is MIA as well. Some fool I know suggested using a little mag-mount CB antenna. Needless to say, I ignored him. Maybe I should stop hanging with this nut...

Can I just use it as a receiver for testing and then test the output tube in a tube tester I have?

Thanks for any and all advice.

I brought one of these beasts to the Lindenhurst hamfest this past weekend. Another guy sold his for $750, but I was in a back room and there was little traffic! Anyway, I still have the two units, and was hoping to sell them as a pair. Both work.

No. 1 has a nameplate by Collins, original meters, top and bottom covers, and original cord. The panel has the paint worn off around the main tuning knob. Price $550 (picked up, $500)

No. 2 is missing the covers (top & bottom), the power cord, and has no name plate, but the front panel is in better shape. Price $450 (picked up, $400)

Both work, knobs are all original, but overall the radios are 7 on a scale of 10. If both are taken and picked up by a single buyer at the same time the price is $825 for the pair.

I live in the Hampton, 113 miles from the Manhattan, mostly highway.

Has the little rubber "doughnut" behind the tuning knob/skirt on your TR-7 (or R7/RV-7/RV-75) gotten all dried up and stiff? If your radio is like most of them, unless this doughnut has been replaced recently it now looks like it's been "baked" and doesn't function very well (it needs to be supple and rubbery for the zero-adjustment to work/feel right).

I have the perfect replacement part, brand new. It's made of the same material as the factory unit, same dimensions, and works great. I even wrote up clear, step-by-step illustrated instructions showing how to do the job, with pointers on what to avoid.

To get your doughnut and instructions, send $2 to:

Neil Rosenberg, K1VY
60 Plain Road
Hollis, NH 03049

If you want 2 or more they're $1.50 each, shipped.

Satisfaction guaranteed, of course. By the way, they also work great on 4-line gear!

Email to K1VY@arrl.net or call (603) 465-2788

Thanks!

Remember that one? 3 transistors no less!

I had one, but lost it when I came home from college. However I kept the instruction sheets all these years and just found them again. So, this being the 21st century, I scanned them and put them on my website. If you want a nice weekend project - this might be it!

I also scanned in a handy old tube chart which I use frequently when repairing old radios.

Both are at:

http://www.megacycles.com

Just go to the ham radio section and look over the new links.

enjoy! -Biz WDï¿½HCO

2348. FT:E.F.JOHNSON Invader 2000

Message-ID: <3AAA7E8E.E12CFF65@fast-trak.com>
Source record: 55558

Just no room for the size of this baby. If you came to check this out, you most likely know the size of this unit. Yes, this is the high power version with the 4-400's. The high voltage supplies have been solid stated as the filament transformer failed. New filter caps throughout. The low voltage supply is still hollow state. The RF exciter and linear section as totally original. Cabinets and chassis' are in very good condition. I have had the 4-400 up and going by running them with another exciter. I have not tired the Invader exciter. Shouldn't be a problem. However, if your familiar with these, you know that is a challenge in any case.

If you just have to have one of these, I'll take trades of the following equipment. Here is a list of what I'm looking for. If you have one of the following and want to trade, email me. Not interested in an outright sale at this time. Maybe later.

Icom 706 mkIIG - Trade even up.

E.F. Johnson 500 complete, need not be 100% operational - will trade the 2000 plus $$$ depending on condition..

E.F. Johnson Desk Kilowatt pedestal only, complete, need not be 100% operational - will trade the 200 plus $$$ depending on condition.

How, I'm in the Twin Cities in Minnesota. Shipping this baby would be very difficult so other arrangements would have to be made. Will discuss if a deal is agreed upon.

Thanks for reading this.

Michael

From: wb0poz@prodigy.net
Message-ID: <98e2c1$6ldc$1@newssvr05-en0.news.prodigy.com>
Source record: 55563

BE CAREFUL! DOn't necessarily believe the meter reading on the built in meter. I got an SB-200 for $15 because the dumb ham that had it thought the power supply crapped out - the meter only read about 300V.

Problem was the 10 megohm meter multipliers had changed radically upwards in value. Found this out when I checked the voltage with my Fluke 77 and *it* crapped out.

It would be nice just to buy a new one!

I need to identify this device to repair a Yaesu FP301 power supply from

about 1978. It says Toshiba on the case. If I can't find one (or a sub)
I hope to rework the circuit to suit an LM323.
It is a 12 volt regulator circuit that has the following interface:

Ground
Bulk supply of 26 volts
Sense from the pass array output
Pass driver out

A second question is where should I look for this kind of information?

Larry !

Good to read about your information regarding the ANC-4. I recently bought it too but has yet to try it but this really make me rush to my receiver's and get it switched on. I live in a fairly big city in Sweden where there are numbers of sources where noise are made. TV-sets, video's, street lights, power lines, computers, micro wave oven's etc. etc.

Regards

Hans, Sweden

I am currently cleaning up and nurturing a couple of elderly BC221.

Anyone know what is the significance of the numbers stamped in red ink
on the BC221 Frequency Meters, eg SC1183A, and SC3085A?

Can these numbers be used to date or trace the origins of these units?

Thanks

Dementia

This is another project that I'll probably never get to......

This radio is quite clean and will probably take little effort to bring back into useful service. Cosmetically it is very good but the hinged cover needs a bit of TLC. Electrically it is unknown as I do not have the facilities to test it. For an external 12VDC power supply to be usable it requires a 3/16" tip telephone plug which I don't have so I cannot power it up. I don't know much about this radio and so I feel it would be better off in the hands of someone who does.

I would like to get $100.00 plus shipping for it. I have seen other examples sell for $200 and up on ePay and other auction sites. If interested please reply by e-mail.

Help!

I have a Wilson WR-1000 Rotor and control that have never been used.
Unfortunately,
I need a 10 pin connector to fit the old Wilson WR-1000 rotor and the
documentation/manual for the rotor and control box.

"I think" I have a connector, or at least I had one, but can not find it.
I never did have a manual.

I'd greatly appreciate any help.

If any one responds, please copy me via e-mail as I don't always get to see
replies on the newsgroups.

It's just TEN days away.
If you plan to attend the "SPRING MEET in the CAROLINAS"
and you haven't mailed your pre-registration yet,
remember that the deadline for pre-registrations
to be post marked is Monday March 12th, 2001.
THAT'S TOMORROW.

Remember, if you are a dues paying member of
the Carolinas Chapter of the AWA you admission is
FREE as long as you pre-register.
If you don't pre-register, you will have to pay the full
at the door admission of $18.00.
WHY WAIT? Save yourself some money to spend
on radios.

If you need a pre-reg form, you will find a printable one
on the clubs web page at: http://www.cc-awa.org

We already have over 200 pre-registered
and about 120 vendor spaces already sold.

It will be here before you know it.

73,

Ron

Just the thing to round out your Knight-Kit collection. THe 1961 Allied Radio catalog describes the speaker like this, "Matching 4 inch speaker for Knight-Kit communications receiver. Features specially designed cone for peaking voice frequencies and reducing QRN. In matching gray metal cabinet with chrome trim. Voice coil is 8 ohms. Size 6 7/8 x 6 5/8 x 5 5/8."

This speaker and cabinet are in excellent condition. Please take a look at it at the above URL.

Bob:
I hate to be the one to break the news, but neither the 51J3 (R-388) nor the 51J4 I have sitting here, both second owner from state agencies, and never modified, nor the advertising literature photographs nor the replacement knobs have cranks on them. Aftermarket 75A4 knobs had spinners, but no original Collins gear that I know of had them, although lord knows, some of them sure needed them. I remember a novice friend who drilled a knob and installed his own back in the 50s, but that is the extent of my exposure to 51J cranks.

2403. Dynamotor Starting Current Question.

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-03-12 02:45:34 UTC
From: novatech@eskimo.com
Message-ID: <98hd8e$gd8$1@eskinews.eskimo.com>
Source record: 55513
Cross-posted to: rec.radio.amateur.boatanchors,rec.antiques.radio+phono

I have DM-21 dynamotor for a BC-312 radio.

When connected to 12 volts (16volts no load, from an heavy duty battery charger), it takes about 10amps for several seconds before it spins up and drops to a reasonable running current (about 2 amps, no dynamotor HV load).

Is this normal?

Everything seems to be working, but I am just curious about this.

TIA,

Steve.

Source record: 55515
Cross-posted to: rec.radio.amateur.boatanchors,rec.antiques.radio+phono

The common name for a dynamotor is "rotary short". You could always tell when the old police cars were transmitting - because the lights dimmed.

The extra current will continue until the motor gets to full speed, but my recollection is that it should not be several seconds- more like a few. Make sure the bearings are free running. Most of the problems I have seen is too much lubrication rather than too little. I had one dynamotor that someone ran a lube gun into. I did not figure it out until I smelled it.

Those were the days. 1954 Buick, ARC-5 transmitter modulated by a carbon mike in the link output, dynamotor in the trunk and a 1 tube converter on 80 meters into the radio. The good thing was that I could not work many people - which helped prevent running the battery down.

Years later, I converted a dynamotor into a wind generator. The problem was that the hub was from an old Perris Dunn wind machine. One night the wind came up and the next morning I noticed the blade was missing. It had separated at the hub. It took me two weeks of searching ever increasing circles before I found it up in a tree in my woods - about 100 feet away. That was my last experience with a dynamotor.

So, it may be splitting hairs to argue over several or a few seconds. It it works and does not smoke, perhaps it is ok.

Colin

Source record: 55519

For sale a Collins 75S3 Receiver (winged emblem), at least CCA very good condition. It has factory installed 250 KHz CW filter and standard SSB filter. The receiver has been serviced and aligned and several capacitors replaced. Works fantastic. The front panel, knobs and knob inserts are perfect. Trim ring and cabinet have original paint. They have a few very small scratches and a couple of very small dings, but overall looks great. Chassis could use a good cleaning. Original manual included. $510 plus shipping.

Message-ID: <tapfhlsvcdv0ef@corp.supernews.co.uk>
Source record: 55525

Racal RA 218 Sideband Adapter & Fine Tuning Unit.
This Racal accessory was designed specifically for use with the Racal RA117 Receiver.
The unit takes its input from the 100kc's if output of the receiver and converts these signals into the audio components of the side bands.

Also contained in the unit is a Fine Tuner.
This is entirely independent of the sideband circuitry.
The Fine Tuner,which has an output of 1.7 to 1.701 Mc's is used as a fourth mixer local oscillator.

Independent output levels are provided for each sideband.

The RA218 is a self contained rack mounting unit which matches the RA117 Receiver.The unit uses a total of 12 tubes.
General condition is good,the front panel is undamaged,all control knobs are original.
The unit has been tested and is in working order.

The price of this rather scarce and very useful accessory,which includes the cost of packing and air freight to the USA, is just $395 US Dollars.
If you require more information or wish to order,please contact Graham Leo
info@radio-exports.com
Thank you for your interest and time.

Moggy2,

Many thanks for the reply, I hoped someone in the USA would know the answer.

OK on the red marks being inspection stamps. I had wondered if they might be inventory numbers or were inspection stamps.

OK also on the date being in the order code. I had wondered about that but did not like to assume too much.

That dates these units at 1942 and 1943, and they are now working well after being in storage since about 1962.

Sorry about the light-weight boatanchor question, but I do have a Racal RA17, which is heavy enough to qualify me for this NG ok!!!

Regards

Definitely Demented (UK)

(end of big snip)

Colin,
If you were modulating with a carbon mike in the link output, it's easy
to
understand why you couldn't work many people! (grin)
Wasn't it a great trick to tie the PE-103 dynamotor from the "tank" set
to the ARC-5's" ? Transmitted like crazy, but after about 15 minutes it was
necessary to push the car to start it! (and if your '54 Buick had a
"dynaflo"
transmission, even that was not an option!)
Lynn, W7LTQ since 1947

I don't know exactly how it was done, but I do know that each one had its own individual calibration book. The serial number of the meter and book match, of course.

Frequency counters were available when BC-221s were being made. They were big, expensive and complex, but not out of the question for a job like calibrating frequency meters. All that needed to be done was to couple the output of the frequency meter to the counter, dial up the first frequency setting (say, 2000 kc.) until the counter read exactly that frequency, record the dial reading, and move on to the next frequency. A lot of work, but nothing compared to the work of, say, building a bomber.

2439. FS.Eddystone 740 Communications Receiver.

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-03-13 09:30:41 UTC
From: "radio-exports.com" <info@radio-exports.com>
Message-ID: <tarq3lf7ntju69@corp.supernews.co.uk>
Source record: 55449

The Eddystone Model 740 Communications Receiver is an eight tube receiver dating from around 1950.
Frequency coverage is in four switched bands,viz.,550-1200kc's, 1.5-3.2Mc's, 4-9Mc's and 12-28 Mc's.
The receiver is in its original metal cabinet,all controls,knobs and switches etc., are original and the calibrated markings on the tuning dial are clear and not scuffed.
The receiver is designed to operate on either 110 volt American supplies or 200-250 volts European.
The receiver is in working order and comes complete with a copy of the schematic and full alignment instructions.
The price for this fairly scarce model Eddystone Receiver,which includes the cost of packing and of air freight to the USA is just $380 US Dollars.
If you would like more information or wish to order,please contact Graham Leo info@radio-exports.com
Thank you for your interest and time.

2440. Re: BC221 Calibration

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-03-13 11:50:55 UTC
From: Alan Melia <Alan.Melia@btinternet.com>

Source record: 55479

I believe it can be done relatively easily, without any external equipment, other than to tweak the crystal to the right frequency. (trimmer under the label).

There are a number of primary hetrodyne frequencies that can be determined, and measured/logged (n*crystal +/- m*VFO). Then the weaker intermediate spots are found and logged. All the rest....the majority of the table is then determined by linear interpolation between these measured points. Unfortunaely a lot of amateurs dont realise that the cal book should have the same serial number as the unit, else it is useless. I have a feeling (but I may be wrong) that only one call point per page is needed for the accuracy required.

Not many know how to measure frequency these days if it doesnt come up in digits!!

Cheers de Alan G3NYK

Looking for Raytheon, Apelco, and Webster CB radio equipment
for my personal collection. I need the following models (but
I will consider any others as well):

Raytheon:
Tube-type: Raycom, Raycom II
Solid-state: Raycom III, Raycom IV, Ray-Tel TWR-9, Ray-Tel TWR-11
Hand-held: Ray-Tel TWR-8, MW-2, Regal Ray-ette, Super Ray-ette

Apelco:
Tube-type: AR-9, AR-10

Webster Bandspanner:
Tube-type: 411 (labeled "Four-Eleven"), 412
Solid-state: 550

Visit my Raytheon CB radio web site:

>individual calibration book. The serial number of the meter and book match,
>of
>course.

If you look at the printing in the book, it looks like it might have been printed by a full character printer. I suppose it is possible there might have been some mechanical servo to turn the dial and send the information directly to the printer. Just a guess.

Doing it all by hand would seem like a gargantuan task, so if it was me that was given that job, I'd have thought of something to shorten the time per unit.

I could give you some examples of similar problems I've faced, but they're not relevant to this newsgroup.

Decals/Dial Scales Update (RSE 3-13-2001)

In order to expand the line of translucent and opaque dial scales, most replacements for glass dial scales have been discontinued. I am currently discussing the making of these dial with another shop and will post here when information is available. If there is one you need please let me know.

Decal and dial information and pricing can be downloaded from our web site: http://members.aol.com/rockseaent/

We will be closed from March 16 through April 2 and re-open on April 3. We are normally closed during the last two weeks of each calendar quarter.

Thanks, Mike

Dear Moggy,

Hmmm, Over here, Moggy either refers to a cat, or to a elderly Morris Minor motor car. Either way I guess we were just too polite to comment on anything slightly eccentric seen in a news group.....Hi.

Never had any dealing with Anchor Surplus, and sorry but not familiar with the MK328 set. Spy sets are not so common, probably due to the small production runs.

High Cross is about 20 miles south of here, just south of Barkway where the GB3PI 2meter repeater is located.

Best regards G8DJK

2468. Vintage VHF/UHF equipment

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-03-13 22:31:28 UTC
From: "Phil T. (VA3UX)" <phil@vaxxine.com>
Message-ID: <3AAE9FC0.18791304@vaxxine.com>
Source record: 55477

have two pieces of what I would call "vintage" commercial radio
equipment.

One is a GE Transmitter/Receiver combination; all vacuum tube, power
amp
uses a 5894. Currently set-up for 168.99 Mhz. This is the original
cabinet which is about 3 feet tall, 2 feet wide and about 10" deep
(kinda
of like a big cereal box). The receiver and transmitter are on separate

chassis and can be removed from the cabinet. each has its own integral
power supply. Weighs 60 - 75 lbs (estimate)

The second is a Motorola repeater set-up for 412.0125 Mhz
transmit/417.0125
Mhz receive. This appears to be vintage solid state. Weight is around
80
lbs+ (estimate). Cabinet is similar size and shape to the GE unit
above.
Model number is XC34MSY-3IQ1CT.

These were both working when taken out of service last year. I bought
'em
but I really doubt I'll get around to using them (too many other
projects
on the go).

Any interested parties out there, please make reasonable offers. I'm
not a
VHF/UHF guy, so if these are just plain junk, feel free to tell me so.
There's a good pile of parts in these that I can use for something else.

Please reply direct to <mailto:phil@vaxxine.com>

Thanks

Phil

I have a Pierce Simpson Bengal 23 channel SSB/AM base station for sale. It is in decent condition, comes with 3 prong mic, has AC/DC power, I don't have the DC cord though. Has PA and external speaker jacks, takes standard PL259 antenna. I can reach PA turnpike no problems (about 7 miles) on a K40 mobile antenna from my basement, but the unit probably DEFINITELY needs tuned (I am assuming) about a 7 cosmetically but everything is there and works ok. Has S/RF and Mod. meter

I want to get into 2 meter so I am selling my old gear.

asking $75 obo

>
I found the following, purely by chance while looking for something completely different:

http://webhome.idirect.com/~jproc/ve3fab/bc221.html

A 126 tube computer was developed to do the job semi-automatically. All of the points in the book were not individually calibrated - they were interpolated from a set o points that were actually measured. See the site for all of the details.

I won't argue semantics as to whether the system used was a "computer" in the modern sense, because it wasn't a general purpose device. Today I'd call it an automated calibration system. Quite an accomplishment, considering the technology available, the demands of the war, and the need for it to be a production device.

Many thanks to VE3FAB and his excellent website.

��� It is a good job, the raised edge of the knob is milled level and the hole the spinner is mounted in is threaded the entire way through the knob, and the crank turns freely.� I can appreciate how difficult it is to thread bakelite.

��� I do have the manual to this particular radio, I will find it and see if a spinner is shown.� Seems there are a lot of filter and VFO variants and even a 1 or 2 RF stage variant with the 51J-4.� This one seems to have all the filters and 2 RF stages. This was the radio I used 3M Super Weatherstrip adhesive to repair several broken ferrite tuning slugs.

Nope. Ham Radio is not dying. Just getting weeded out. When all the dust settles and people like "Kooky Child 8 Just Being Obnoxious" has his license to JAM taken away by the FCC, and his shrink finally puts him away, if does not drink himself to death first, then Ham Radio and air waves will be a much better place.

I'll be taking the following to the Baltimore (Timonium) Hamfest the end of the month. Let me know if you're interested in anything and I'll hold them.

HQ-150 w/ matching speaker very nice cond. $175.00
Viking II w/ 122 VFO nice condition, ER audio mods, works quite well $250.00
SX-73, works quite well, no dial lock. TM included $475.00
Elmac AF-67/PMR-7 w/ books. They work! no supply, though $140
Eimac 3-400Z tubes NIB (have 4) $100 each.
Gonset GSB-100 (sans cabinet, but works FB, w/ book) $150.00

See you all there!!!

Bought an I-72-J on Ebay. The seller (jrol) took the pains to open the case
and wrap the tubes in foam. The postal service did a "bang up" job on it
and all the tubes were loose in the cabinet, but unbroken. I got lucky
because of a "Good Guy."

I have for sale, once again, a bunch of these real neat GPS antennas. I had 12 units that sold out in a few weeks last year. Please check out the 3 pictures for full information. Some have red gaskets, some have white and some have black gaskets. This gasket seals the antenna when you drill the hole for securing it. No difference but in case you purchase one the color of the gasket might vary plus when they are installed you don't see it anyway. They all have white tops. 2.75 inch wide X .75 inch thick. Antenna requires 5 volts DC and receives its power form the GPS unit like the Garmin GPS-1, GPSII+, GPS III plus etc. units that provide power up
to the antenna. $55.00 includes FREE USPS Priority mail shipping in the USA only. Payment via PayPal or USPS Money Order or Western Union money orders.
Money orders and will ship in a few days, if you do send a personal checks I will ship when it clears
the bank. All units have been tested and are working. Have about half a dozen to dispose of. If interested, send me an email! Thanks for your interest!

IMPORTANT - - - if you do use a Radio Shack or other such "wall wart"
to power up that 3000, be sure you set the polarity correctly. The tip
of the connector is NEGATIVE: in other words, that radio (like all the
transistor T.O.s before the Royal 7000) are POSITIVE ground.

2482. FT: Icom IC-W31 dual band HT pkg for GP-68

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-03-14 04:28:44 UTC
From: foxblaine@aol.com
Message-ID: <20010313232844.19187.00000533@ng-dh1.aol.com>
Source record: 55492

Greetings!

I would like to trade my nice Icom IC-W31 dual band (2m/440) handheld for a Motorola field programmable VHF HT. Will consider any 'commercial' (maybe even another amateur) transceiver that does the PL tone of 229.1 -- That PL is an 'oddball' tone, and most amateur transceivers do not have it. There are some exceptions. I would really prefer a GP-68 in good shape with accessories. My Icom W-31 comes with 3 batteries (2 BP-173 batteries, 9.6V @ 650 mAh, and 1 BP-171, 4.8V @ 700 mAh), speaker mike (clip is broken, easily repairable), leather case, and charger. I know some of the Alinco HT's do 229.1 PL, but not all of 'em. The W-31 has cross-band repeat capability, dual receive, etc. Nice rig. Please e-mail with offers!

>

Joe,

I don't see your problem.

I'm a landlord and constantly get those Western Union money orders
from tenants. I've never had one that was bad.

What do you mean that your bank won't "cash" them?
Do you want to withdraw the money before they've cleared?
My bank doesn't allow that but then it doesn't allow that for postal
money orders either.

ANYTHING can be counterfeited.

I've had no problems DEPOSITING Western Union money orders or any
other kind of money orders.

I occasionally sell ham gear via ebay.
I'll take any kind of payment, even personal checks.
I simply tell the buyer that their checks or money orders have to
clear before I ship the items.

You know, we expect a lot of buyers.
We expect from payment from them before we ship the items.
That forces them to trust us. Trust has to work a bit in both
directions, obviously tempered with common sense.

If a seller asks me to pay by postal money order, I won't do business
with him. WHY?? Because I live in a rural town with only a contract
post office in the Florist's shop. He won't handle postal money orders
because it requires him to keep a large amount of cash on hand.
Thus, it's not just a matter of waiting in line, I also have to drive
into another town to get a postal money order.

My situation isn't unique in the country.
Many areas, too small for a regular post office have contract post
offices in local businesses that don't handle money orders.

73,
Doug/WA1TUT

Brenda,
The individual who has been using foul language and character
assasination on this group is doing the same and far worse on another
ham radio news group. I would very much like to see his postings banned
from this and the other newsgroups. Who can I write to on this matter?
Is the moderator of this group available thru email?

One more thing. Recently I had the honor and pleasure of listening
to K4ZDH here in Youngstown at a local MVARA meeting. The subject of
this kind of verbal harrassment and poor manners/operating practices
was central to his theme that evening. We as a group can do more to get
rid of this type of so-called operator. Hollingsworth's message was on
this same line, that is, what we can do as a group to rid ourselves of
the verbal bullies and intimidators.

Thanks and 73s,

Fred Sole

2504. Re: Need info on HQ170 Switch

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-03-14 21:50:04 UTC
From: Bis Wichy <wd0hco@ev1.net>
Message-ID: <3aafe82d_1@newsa.ev1.net>
Source record: 55314

There are two type of wafer switches used in Hammarlunds.

One type uses two "friction plates" on the switch body and an stamped indentation that falls into depressions on the opposite friction plate as you turn the switch.

The second type is the same design but a bit more expensive as it uses one or more ball bearings between the plates. This is the type that is in the Hammarlund 170 and 180.

You should check your switch and see your bearing(s) are missing.

It might be all you need are some steel "balls".

Warning! if you add balls to your Hammarlund, you will notice Ham voices drop in pitch. (HIHIHI - oops sorry!)

You can, of course, replace the old switch with any another 3 position switch with the same number of poles.

Hope that helps! -WDï¿½HCO

Message-ID: <20010315011618.04277.00002710@ng-fi1.aol.com>
Source record: 55261

Hi All,
I need the NG's help here. I have some parts from a Grundig Westar radio here that need to go to a good home where they will do some good.
The story is that my tech repairman had been in South Jersey and saw this Grindig Westar console sitting at the curb for pickup/disposal, he pulled the chassis from the console and after several months of using the chassis, he chopped it up for parts. I tried to get him to sell the chassis, but he wouldn't budge. Now I have the leftovers, such as the silk screen painted dial glass and some of the chassis parts that he was going to throw away.
If anyone out there has knowledge of a Grundig reflector, please cross-post this ad for me as I am not a subscriber to any eurpoean radio NG's.
I also have the push-button assembly and the power xfrmr as well as a couple of audio xfrmrsand what is left of the chassis. I know these are like hen's teeth to find and I cannot stand to see them get tossed away. If anyone knows anyone else who can use these parts, please have them email me directly and I can send photos of what I have here.
Thanks to all....
rgds,
Mark S.

2514. FS.V.Rare WWII Loop Aerial (British R.A.F)

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-03-15 12:15:46 UTC
From: "radio-exports.com" <info@radio-exports.com>
Message-ID: <tb1ch1jls4uuac@corp.supernews.co.uk>
Source record: 55247

Extremely rare,World War II Loop Aerial,Type 17,Air Ministry Pattern
10D16950
As used by the British Royal Air Force for direction finding purposes.

If you are assembling say the R1155/T1154 receiver/transmitter set up, which
was used in the British Lancaster Bomber,finding a genuine R.A.F. Loop
Aerial from the early 1940's ,which you will require in order to demonstrate
the D.F. part of the equipment, is becoming almost impossible.
This is just such an authentic and original item.
It is a very compact unit,being an encased, multi-turn loop, of
approximately 8 inches diameter.
The loop is smartly shrouded in an original tufnol type of molded
material,which is typical of the construction and design of these British
Loop Aerials,as used during the Second World War.
As you would expect, it has an azimuth indicator with two scales,red & blue
(left and right handed), calibrated 0-360 degrees.
The unit is fitted with an adjustable brake and quick release mounts.This
Loop Aerial is in good mechanical condition. The loop windings have been
tested for continuity and are fine.

The price for this extremely rare item, including the cost of packing and of
air freight to the USA is just $360 US Dollars.

If you would like more information or wish to order,please contact Graham
Leo info@radio-exports.com

Thank you for your time and interest.

Hi Dick,

One of the boatanchor paint sources seems to be under water right now.
Not sure what the problem is.
Your best bet is to go to an auto parts store and pick out one of the silver paints
that closely matches. The Aluminum
paints come out a little to bright.
I have used the silver paints with good results.

I drove to Paris, Texas(2hrs ne of Dallas) yesterday with some friends to view this new store. Wow!!! I was impressed! We were like kids in the 1060 radio candy store. It consists of about eight rooms.....the Hallicrafter-Hammarlund , the Collins, Nationals, Drakes, RME's, Johson-Vikings, snf even a military radio room(new bc-348's, sp-600's new in the crate), etc. Finally got to "play" with a Hallicrafter SX-88(they have several). Yes, some prices were a bit high, but they come checked out and working. I've been looking for my old novice-days receiver for some time , and therefore purchased a new(came out of a collection and was absolutely new-pristine) Hallicrafter SX-101. I can't speak for others, but my experience there is one I will always fondly remember. Jim.....WB5LXZ

If anyone needs to run off a calibration set for a BC-221 or an LM style freq meter, there is a little ditty that does this, if you can measure the 100khz calibration points.

ftp://piobaire.mines.uidaho.edu/pub/Glowbugs/Programs/bc221lm.zip

It is crude, and ugly, but will run on a mainframe with a punch card deck, for boatanchor purposes, if need be, or any of the usual PeeCees.

2540. FS.Eddystone Panoramic Display

Newsgroup: rec.radio.amateur.boatanchors
Date: 2001-03-16 11:09:42 UTC
From: "radio-exports.com" <info@radio-exports.com>
Message-ID: <tb3t13ot0lk786@corp.supernews.co.uk>
Source record: 55269

The Eddystone Panoramic Display Unit,Model EP14 is a general purpose display unit for use with any receiver having an intermediate frequency in the range 5-60 Mc's.
On this high quality Eddystone unit, a maximum Panoramic Display width of 1 Mc is available. This can be narrowed to a Panoramic Display width of less than 30kc's, to facilitate detailed analysis of individual signals.
Used in this manner, resolution is in the order of 2 kc's at the slowest sweep speeds.
The panoramic display unit uses a green trace cathode ray tube which is fitted with a hood ,to permit viewing under difficult lighting conditions.The screen is fitted with an engraved graticule for direct measurements.
A built in crystal calibrator gives marker pips at 100 kc's intervals for accurate calibration of the frequency scale.
Four,selectable sweep speeds, simplify the accurate presentation of widely differing signal displays.

In addition to its main application as a panoramic display unit,the Eddystone EP14 has provision for use as a wobbulator.
It also has many other applications as a versatile test instrument, including frequency measurement,drift checks,and use as a sensitive RF volt meter (20 microamps f.s.d.).

Advanced design,rugged construction and high quality components are used throughout.The unit is fitted with a blower to allow prolonged use at elevated temperatures.

The unit employs 15 tubes in addition to the C.R.T. and solid state power supplies.
Size is 19" wide x 5.25" high x 15" deep and the unit weighs 36lbs.

Condition of the display unit is near mint and it is in full working order.

The price of this versatile Eddystone unit, inclusive of the cost of packing and Air Freight to the USA,is $550 U.S. Dollars.

If you require further details or wish to order,please contact Graham Leo info@radio-exports.com

Thank you for your time and interest.

Hi, I have a Hallicrafters SR-160 that starts to screech/whine when there is little or no receive signal present. The static on 20m is usually enough to prevent the problem, but not always. Does anyone know what may be causing the problem? I've had the rig for 9 years and use it primarily as a reciever. I know I have never changed any of the tubes and I don't know how long they were in before I was given the radio. Thanks!

Being tube based, it probably has a number of grid-leak bias circuits in the received signal path. If the capacitor becomes leaky, the bias won't hold up without a signal, changing the operating point of the tube (and, for many, the gain). Those old capacitors may be the problem.

Best of luck!

Jim Horn, WB9SYN/6

Mike,

My guess is you have one or more bad decoupling capacitors in the high voltage line to your RF and/or IF amplifiers stages. With the reduced signal, the AGC allows the gain to go to max and there is enough positive feedback through the high voltage supply line to cause oscillation.

Try temporarily paralling each one of these capacitors with another of equal or larger capacitance and see if the noise goes away. If it does, replace the old capacitor.

Good luck and 73,

Harvey, K5LJM

Bill,
Thanks for the info. I have taken steps at YSU to have this person blocked. But I think a tactic that is far more effective is to totally ignore this individual. He gets his jollies by ataganizing others. If no one replies to his postings, he will lose his audience and go away. Right now thats what keeps him coming back. He has commanded attention. If he gets none, he is the big loser.

Source record: 55337

Atlas 210X in good physical and working condition. Over 100W out on 80-15m and 40W out on 10m. Includes a new Shure 527A handheld mic. This is the modern replacement for the 404C that originally shipped with the radio. In addition there is the Ten Tec T-Kit 1551 audio speech processor, fully assembled and installed in a metal enclosure. According to Ten Tec, this is the same audio speech processor that's in the Omni VI. Also included are the radio's DC power cable, the speech processor's power and audio cables, and the orginal Atlas 210X Installation, Operation, and Maintenance Manual. You can see the big picture at http://snoopy.cmagic.com/Atlas210X.jpg.

Price is $210.00 shipped UPS CONUS only. Prefer money orders. For personal checks, shipment will be held until the check clears. Item's will not arrive DOA, but otherwise sold without warranty.

Looking for a National Velvet Vernier knob/dial to match the one I have now.

It is black, with white lettering. Numbers are 0-100 on the skirt. Knob has straight line knurling around the edges. Knob diameter is about 2 inches, skirt diameter is about 3 and 1/4 inches. There is an index to read the numbers from. My particular one has a rectangular flange underneath with four holes for mounting.

Would like one in very good to pristine condition to match the one I have. Perhaps I would be interested in a pair of another style.

Thanks for reading the posting.
